LIM is the first circuit simulator that exhibits linear numerical complexity. LIM's advantage increases dramatically with the size of the network.

LIM classifies networks into **nodes** and **branches** and does leapfrog updates.

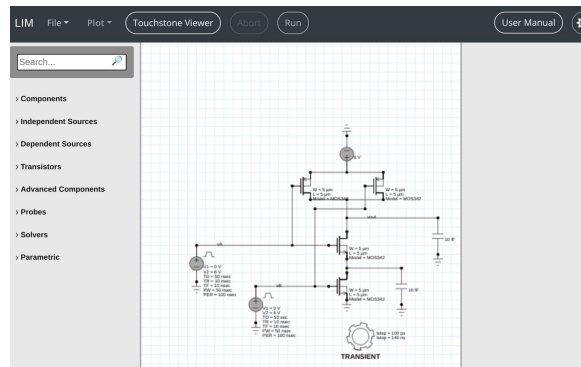

$$I_{ij}^{n+1} = I_{ij}^n + \frac{\Delta t}{L_{ij}} \left(V_i^{n+\frac{1}{2}} - V_j^{n+\frac{1}{2}} - R_{ij} I_{ij}^n + E_{ij}^{n+\frac{1}{2}} \right)$$

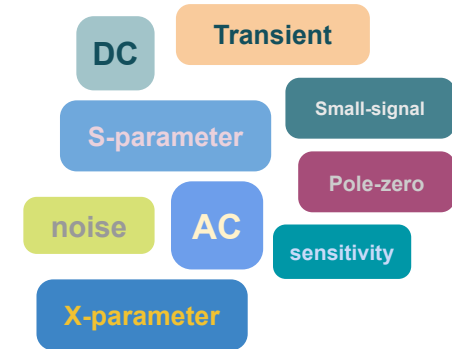

$$V_i^{n+\frac{1}{2}} = V_i^{n-\frac{1}{2}} + \frac{\Delta t}{C_i} \left(- \sum_{k=1}^{M_i} I_{ik}^n - G_i V_i^{n-\frac{1}{2}} + H_i^n \right)$$

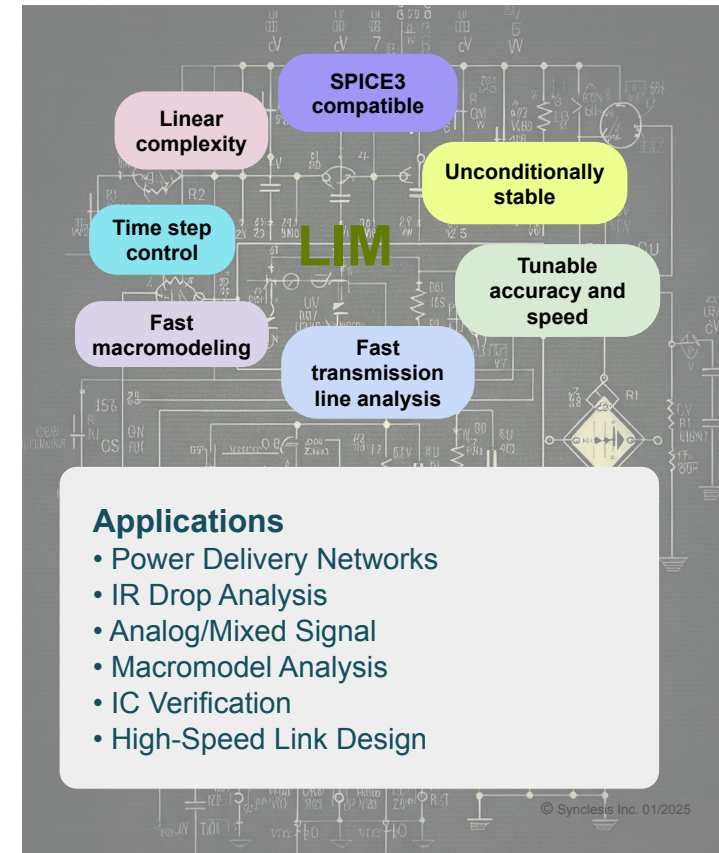

LIM comes with a modern web-based UI and a scalable backend.

<https://designcon2025.syncsis.com>

LIM supports various analyses both in time- and frequency-domain by using appropriate excitations to extract information.

Applications

- Power Delivery Networks
- IR Drop Analysis
- Analog/Mixed Signal
- Macromodel Analysis
- IC Verification
- High-Speed Link Design
