

Another Zero Day For Google Chrome?

This is the 7th zero day on Chrome this year. They haven't provided a lot of information for security reasons and won't until the large majority of users have updated Chrome.

What's a Type Confusion Bug?

It's a form of XSS vulnerability. This is an exploit that allows you to put code into web applications, and there are prevention methods against this which cause the input to be changed so that code isn't run. Occasionally this can be used to a hackers advantage, by figuring out how the input will be changed you can put an input which will be modified to cause a vulnerability, a double bluff. This is exactly what has happened in the latest google vulnerability.

Why We Need to Stop Metaverse

At the moment VR and AR is a gimmick and is used to play quirky games, however Meta (Facebook's parent company) has invested a substantial amount into what they call the Metaverse. The Metaverse is an environment aimed at providing shopping, work and more without moving a muscle.

Each person has an avatar which the headset tracks facial movements to create a realistic impression so that everyone can interact and this is where the problem lies...
