**DSC-MM CONTROL PANEL**

The Dairysense milk meter system is one of the most important tools in sustainable milk production. The Dairysense milk meter unit helps you carry out the milking process for your animals in the healthiest way possible. It allows you to measure even small amounts of milk with high precision. It transfers the measurement value of the milked animal live to the livestock management system and keeps a record of the entire milk history.

FEATURES

- High precision milk measurement
- Precise milking process management
- Milk yield measurement
- Low milk warning
- Mastitis warning
- Temperature warning
- Milk flow rate measurement
- Milking time measurement
- Divider gate support
- Individual identification
- Computer-controlled milking blockage
- Programmable pre-massage
- Automatic milking termination

INCREASE YOUR PROFITABILITY WITH EARLY DIAGNOSIS

The Dairysense milk measuring system, integrated with mastitis and temperature sensors, monitors udder health during each milking. This sensor, developed for the detection of subclinical mastitis, provides early warnings as mastitis begins to develop. While measuring conductivity and milk temperature in real-time during milking, it alerts you at the onset of diseases. This system plays an active role in reducing your treatment costs by enabling early intervention.

ACCURATE DIAGNOSIS FOR EFFECTIVE EARLY TREATMENT

Accurate diagnosis and early treatment play a crucial role in preventing the spread of contagious diseases like mastitis. Pain during disease processes can significantly impact animal welfare. Mastitis can also affect reproductive performance in animals. For these reasons, early detection of mastitis in cows is important for both animal welfare and herd health.

Dairycollar Smart Collar

Today, farmers aim to achieve more sustainable and efficient cattle farming by optimizing the health and productivity of their animals. The Dairycollar collar technology offers an innovative solution to reach this goal.

Dairycollar provides high accuracy in detecting estrus while also identifying hidden heats. By monitoring the animals' rumination and feeding processes in real-time, it allows for comparisons with individual, group, and herd averages. This enables farmers to continuously monitor their animals' nutrition and digestion activities.

Additionally, it detects and reports abnormal behaviors such as lack of rumination and feeding during disease processes. This feature provides a significant advantage for early disease detection and intervention.

The Dairycollar collar technology offers farmers more effective herd management, enhancing both animal health and productivity. This innovative solution is an indispensable tool for businesses aiming to maximize efficiency in modern cattle farming.

NOTIFICATIONS

- Estrus Tracking
- Insemination Timing Interval
- Rumination Monitoring
- Feeding Duration Monitoring
- Irregular Estrus Warning
- Abort Alert
- Resting Time Monitoring
- Temperature Stress Monitoring

s-TAG PEDOMETER

Technological solutions are of great importance for increasing efficiency and optimizing herd management in modern livestock farming. The s-Tag pedometer technology stands out in this field by offering an excellent estrus tracking system for both heifers and cows.

s-Tag not only provides high accuracy in detecting estrus but also identifies hidden heats. It also helps you monitor animal health and the pregnancy process, allowing you to maximize the productivity and welfare of your animals.

In addition to tracking the start and end times of estrus, s-Tag calculates the most suitable insemination timing interval in real-time. This feature is crucial for a successful breeding program.

With IP67 level of external protection, it delivers reliable performance in all challenging conditions. Its durable design allows you to continuously monitor the movements of your animals.

Step into a new era in herd management with s-Tag pedometer technology, elevating the health and productivity of your animals to the highest level.

NOTIFICATIONS

- Irregular Estrus Warning
- Abort Alert
- Lameness Warning

THE S-TAG PEDOMETER AND THE DAIRYCOLLAR COLLAR CAN OPERATE ON THE SAME INFRASTRUCTURE !

One of Dairysense's primary goals is to provide an efficient system that contributes economically to businesses. While businesses often opt for pedometer technology to address reproductive issues, collar technology is used to solve both health and reproductive problems in dairy herds. Using both systems simultaneously requires separate infrastructure.

To keep investment costs at a minimum while achieving maximum efficiency, we have combined the receiver antennas for both systems into a single structure. This allows businesses to equip heifers with the s-Tag pedometer or dairy cows with the Dairycollar collar as needed. Both systems can be used through the same interface, enabling seamless tracking of animals.

The greatest advantage of Dairysense is highlighted here. By using the s-Tag pedometer for heifers and the Dairycollar collar for dairy cows, you can track all animals economically and effectively with a single infrastructure, balancing investment costs.

DSC-RC BARN INTERIOR ANTENNA FEATURES

- Can work in conjunction with s-Tag and Dairycollar technology.
- Data from animals within a 600-meter area can be collected with one antenna.
- Not affected by electrical fluctuations in farms due to its wide operating voltage range.
- Durable against environmental conditions with an IP67 protection rating.

ENHANCED IDENTIFICATION SYSTEM

Herd management systems require accurate data for proper analysis. Success in milking parlor identification ensures that the milk data of animals is recorded accurately and regularly. Unlike other systems, the Dairysense identification antenna features an adjustable reading distance. It provides adjustable readings up to 150 cm by filtering out all parasitic signals in the environment. The antennas are not affected by environmental conditions and can be used for years without maintenance. Even if Dairysense identification antennas do not have a direct line of sight with s-Tag and Dairycollar devices, they still achieve a 99% identification rate.

INNOVATIVE SOLUTION THAT DOES NOT REQUIRE A DOOR SENSOR!

One of the biggest issues in herd management systems is the frequent malfunction of sensors that track the position of entry and exit doors. Most systems rely on these door sensors for animal identification. However, when the sensors malfunction, the identification system becomes inoperative, leading to losses in milk data and making it impossible to track which animal produced which milk data.

The Dairysense Identification System addresses this problem fundamentally. By performing individual identification at each unit without relying on door sensors, it prevents the loss of milk data and offers a more reliable and uninterrupted identification process.

SORT GATE

In large herds, separating cows during the treatment process can stress the animals and create a tiring workload for the staff. The Dairysense divider door system works in integration with the herd management system to help you automatically separate animals. This process avoids stressing the animals and saves labor. You can manage animal separation within the milking parlor through the DSC control unit, herd management software, and mobile application.

APPLICATIONS

- Allows for the separation and direction of cows into specific areas.
- Provides management based on the individual nutritional needs of cows.
- Offers separation options for situations requiring veterinary intervention.
- Provides solutions for hierarchy and behavioral issues.
- Used to prevent stressful situations for cows and ensure a comfortable environment.
- Utilized to ensure the safety of farm workers by controlling aggressive or treatment-resistant cows.

**MANAGE THE ENTIRE FARM WITH A SINGLE INTERFACE !**

The Dairysense herd management software provides farm owners with the tools they need to monitor and manage their herds more effectively. The software modules will assist you in making informed decisions whether you are conducting field operations or working off the farm.

Designed to minimize your workload, the Dairysense herd management software continuously tracks each of your animals and sends you all necessary notifications in real-time.

With interactive software modules, you can accurately access all the data you need on the animal card. This ensures that you always have support for the strategies you develop to improve farm productivity.

It automatically designs your daily task lists each day, allowing you to keep track of all tasks related to animals, veterinary care, and farm operations, in addition to your routine processes.

You can create separate user accounts for each position and manager on the farm, and adjust tasks and access permissions according to roles.

With the customizable reporting module, you can report all the data from your farm according to your management strategies and convert these reports into actionable tasks.

FARM MONITORING IN A SINGLE WINDOW WITH THE CONTROL PANEL

If you prefer not to deal with details, you can monitor the entire herd from a single screen with the Control Panel. The panel provides a live overview of animal numbers, condition distributions and percentages, the 7-day and 24-hour farm production status, and lists all notifications from s-Tag pedometers and Dairycollar collars. With the agenda feature, you can track all your custom records on a daily, weekly, and monthly basis. The control panel helps you view the overall herd status on a single screen and access all data details.

The screenshot displays a detailed report of animal performance. The table includes columns for Cow Number, SG5, Group, Milking Start Date, Milking Duration, Milk yield, Conductivity, Temperature, and 10-Day Milk Average. The data is organized into groups, with each group having a summary row and individual animal rows. The table is sorted by 10-Day Milk Average in descending order.

FAST DIAGNOSIS AND OPERATIONAL CAPABILITY

The DairySense herd management software tracks detailed production and activity data of the animals in real-time. Regardless of the number of animals on your farm, you will no longer need to search for animal information among complex paperwork. Real-time data will identify and alert you to milk drops, potential drops, estrus periods, and health notifications for your animals.

EASY MANAGEMENT CAPABILITY

Through the reports available in the DairySense Herd Management Software, you can monitor not only the milk yields of your animals at the end of milking but also the milking durations, the number of clow drops during milking, and compare the latest production data with previous days, all from a single interface. You can also assess milker performance that is not observable by eye through these reports.

The sTag System24 provides you with detailed information on every position related to the production and reproduction periods of your animals. It will particularly guide you in the timing of breeding intervals during estrus. The sTag System24 also allows you to interpret live graphs, helping you to avoid personnel-related errors.

ALL HISTORICAL DATA ON ONE SCREEN WITH THE ANIMAL CARD

With the comprehensive Dairysense animal card module, all operations from the birth of the animals to their exit from the herd are recorded on the animal card. Information about the animals' current lactation periods, treatments, vaccinations, and other procedures, production data, lactation comparison charts, and comparisons of individual milk production with herd and group averages can all be tracked. Historical data can be utilized for any actions performed on the animal. Direct data entry can be done in the field via the mobile application, and it is synchronized in real-time without needing to visit the management office.

ANIMAL CARD

- Defined user events
- Breeding records
- Group changes
- Pregnancy diagnosis
- Dry period separation
- Abortion
- Calving
- Exit from the herd
- Milking status changes
- Culling and infertility alerts and many other records can be kept and monitored live from both your office and the field.

The screenshot displays the DairySense web application interface. EASY TRACKING WITH PHOTO UPLOAD FEATURE VIA MOBILE APPLICATION

The Dairysense herd management software allows you to perform complex tasks in the simplest and most effective way while also creating an organized tracking system. Personnel in the barn can quickly address any issues they notice with an animal by uploading a photo of the incident to the animal's card via the Dairysense Mobile Application, creating notes or linking to potential diseases. This feature can be used not only for tracking the development of animals but also for effective and easy disease and ear tag monitoring.

EASY TRACKING WITH PERSONALIZED REPORT SUPPORT

The Dairysense comprehensive report technology not only includes most of the reports you may need but also allows you to easily create custom reports. You can organize report names according to your preferences and generate reports from approximately 90 available headings using any filters and comparisons you choose. You can define new columns related to the report content, allowing you to develop your own tracking lists within the report. With the Dairysense report module, which has the infrastructure to provide every list you need on the farm, you can also access all statistical data for your farm.

DISEASE

The Dairysense treatment module allows you to keep track of treatments on a daily basis. You can identify diagnoses and processes detected during the treatment of animals. Changes can be made to the medications used during the process, and all actions are recorded in the animal's card. You can track which day of the treatment process the animal is in and review all past successful and unsuccessful treatments.

VACCINATION

The Dairysense vaccination module monitors the vaccination protocols you have created. It transfers animals that fit your protocol to the vaccination list. You can track all animals in the herd that are due for vaccination and those that have missed their scheduled vaccinations.

PROTOCOLS

You can design and monitor all protocols applied in your herd according to your own schedules. When animals that match registered protocols are found, they appear on your task list and remain there until the task is completed. Protocols can be completely customized to fit your farm, allowing you to record and track your processes more easily.

LIVE MILKING MONITORING

With the Dairysense Port System, you can monitor milking live in real-time. During this process, various data can be tracked instantaneously through the software.

- Which unit the animal is being milked in
- Milking parlor automation device locations
- Animal number
- Instantaneous milk yield
- Current milking duration
- Mastitis alert
- Milk temperature
- Flow average
- Flow rate

REMOTELY PROGRAMMABLE PARAMETER STRUCTURE

All devices in the Dairysense Herd Management System can be adapted to any system with its infrastructure parameter system. All of these parameters can be uploaded to the devices via the Dairysense Port System, even if you are not at the device location.

EASE OF ACCESS

- Identification or access to animal cards via NFC tag support or cow number
- Control the entire herd through the control panel
- Access all reports defined on the computer via mobile
- Track agendas
- Access all information on the animal card through the mobile application
- Monitor animal production and activity charts
- Track low milk, estrus, and all other system alerts
- Record all field operations through the mobile application
- Real-time synchronization
