

# Scrotal Male

# Help Your Pet Heal!

for the next 7-14 days

## No Licking!

Licking or chewing at the incision can cause infection.

## Check the Incision

What you see today is normal. Check twice a day for redness, swelling or discharge.

(The small, green tattoo indicates spayed or neutered.)

## Keep it Dry

Water affects surgical glue & opens the incision, causing infection.

## Incisions on Males are

Left Open

It is normal to see swelling & red discharge for a few days during the healing process.

## Separate Animals

Keep females away from un-neutered males.

## Feed a Simple Diet

Do not give your pet junk food, special treats, table scraps or milk.

## Restrict Activity

Inside rest gives the tissue time to heal & helps the incision stay closed.

(No running, jumping, or playing.)

## No Human Medication!

It is dangerous & can be fatal! Your pet has already received long-acting pain medication.
