

3 MONTH HOSPITAL STUDY

BIOPROTECT's efficacy was tested over a 3 month period at 3 different hospitals across the United States. Testing was performed by Microbac Laboratories, Inc., for Hospitals A & B and Chestnut Laboratories conducted the testing for Hospital C. Within each hospital, 2 to 3 high traffic areas were selected for testing including a variety of different substrates. Swab tests were performed every 15 days over a 3 month period in 2010. The tests were monitored by each hospital's environmental supervisor and sent to the third party labs for testing.

Hospital A: University of Louisville Hospital

Hospital A is a teaching hospital located near downtown Louisville, Kentucky. The hospital's emergency room is one of the largest trauma facilities in the country and is able to accommodate up to 86 patients simultaneously. The center is staffed 24-hours a day and admits more than 2,400 patients each year; 40 percent of those are referred from other hospitals throughout the region. No patient numbers were readily available for the inpatient facilities.

Hospital B: Nationwide Children's Hospital

As one of the largest and most comprehensive pediatric hospitals and research institutes in the United States, Hospital B is home to the department of pediatrics for a local university medical school. In a typical year, the hospital sees patients from across the country and around the world. Hospital B is located in Columbus, Ohio and maintains a medical staff of approximately 950, a hospital staff of 6,800, and delivers pediatric care for almost 823,000 patient visits annually.

Hospital C: Freeman Hospital

Hospital C located in Joplin, Missouri, is also a teaching hospital and features a 404-bed, three-hospital system, which includes a comprehensive behavioral health center. The facility has recently completed a \$47 million expansion project. Hospital C is a member of the Oklahoma Osteopathic Medical Consortium of Oklahoma and the regional Osteopathic Postdoctoral Training Institution and an affiliate of Oklahoma State University-College of Medicine.

Hospital A Test Results

As demonstrated on the following certified reports from Microbac Laboratories, a significant decrease in microbes in all areas treated and tested at Hospital A was found. In fact, the average decrease in harmful bacteria and microbes for the three rooms treated and tested at Hospital A was 97.85%.

1.1. The results shown to the right from the Emergency Room Waiting Area of Hospital A shows a significant decrease in microbes when compared to the baseline sample. Swab tests were conducted every 15 days from January 2010 to May 2010 on three surfaces including two chairs and the vending machine keypad. The total decrease in microbes from the baseline test to the last follow-up test for this room was 97.13 %!

1.2 The results shown to the left from Room 4 on the 5th floor of Hospital A also shows a significant decline in microbes when compared to the baseline sample. Swab tests were conducted every 15 days from January 2010 to May 2010 on eight surfaces including the television remote, chair, blood pressure bulb, switch for the night light, drawer handles, thermometer, one wall panel, and underside of the counter lip. The decrease in microbes for this room was an astounding 99.95%!

1.3 The results shown to the right from Room 9 on the 9th Floor of Hospital A continues to show a significant decrease in microbes when compared to the baseline sample. Swab tests were conducted every 15 days from January 2010 to May 2010 on 11 surfaces including the TV remote, chair, drawer handles, bed handrail, controls and tray, IV equipment, outside door handle and frame as well as the frame for the monitor controls. The decrease in microbes for this room was 96.47%!

Hospital A Results			
Room	Baseline	Last Follow Up	Total % Decrease
Emergency Room Waiting Area	3770	108	97.13%
Floor 5, Room 4	3290	116	96.47%
Floor 9, Room 6	167730	76	99.95%

This outlines the data for the baseline and final follow-up testing as well as the total percentage of decrease in microbes for each room tested in Hospital A.

Hospital B Test Results

As demonstrated on the following certified reports from Microbac Laboratories, a significant decrease in microbes in all areas treated and tested at Hospital B was found. The average decrease in harmful bacteria and microbes for the two rooms treated and tested at Hospital B was 68.44 %. This result is lower than generally found in Hospitals A and C. The difference is explained by the notes on the Microbac Laboratories results certificate. Microbac determined the baseline data presented by the previous laboratory was invalid due to poor quality standards. Therefore, calculations for % of decrease were completed using the data from the first follow-up rather than the baseline.

Hospital C Test Results

As demonstrated on the following certified reports from Chestnut Labs, a significant decrease in microbes in all areas treated and tested at Hospital C was found. In fact, the average decrease in harmful bacteria and microbes for the two rooms treated and tested at Hospital C was an astounding 99.84 %!

3.1 The results shown from Room 272 at Hospital C show a significant decrease in microbes. Swab tests were conducted every 15 days from February 2010 to June 2010 on 19 surfaces including the bed rail controls, television control, sink counter, monitor controls, light switch, closet door handle, privacy curtain, toilet surround and handle, chair, bed tray, sliding door handle, chart holder, and windowsill. The microbes in this room decreased by 99.87 %

Room 273	103940	193	99.81%

Final Conclusions

All antimicrobials are not created equal. It's important to understand the basic chemical, physical, and biological properties of an antimicrobial so the best choice can be made. Because of its unique mode of action and inability to migrate from a treated surface, our technology is the obvious choice to minimize environmental contamination and the development of resistant organisms. Our EPA approved products are safe for the environment, humans, and pets. They are non-dissipating, non-leaching, non-migrating from the applied substrate and cannot be absorbed by micro-organisms or by humans.

Door Blind Control	<10

Note - The reason the rooms below have no pre-BioProtect 500 results is that they had just been cleaned prior to arrival on site, and would not have given meaningful baseline readings. The hospital selected this room being similar and adjacent for baseline testing.

Floor 4, Room 4009	10th Feb 10	1st Mar 10	15th Mar 10	5th Apr 10	22nd Apr 10	12th May 10
