

Pre-selector Frequency Dial for S-Line and KWM-2

The Collins S-Line and KWM-2- series have pre-selector dials calibrated only for the "olde tyme" amateur radio bands of 80, 40, 20, 15, and 10 meters. When the units are used for the WARC bands, or for the 60-meter band, the approximate dial indication has to be determined from the graphs in the manuals. It is the same for operation on any frequency outside of those amateur radio bands.

To enable fast tuning, and to insure that the proper pre-selector adjustments are made, an alternative dial is now available which can be easily installed on the equipment. All that is required is to remove the paper backing and then place this new dial over the old one. No additional adhesive is required and the new dial calibration can be removed at any time to restore the front panel to the original configuration.

Basic Design

Dial installed on Collins 75S-3A receiver

Dial installed on Collins 75S-1 receiver
