

How to View Fields in the Map Tab

When fields appear in the map window, the default view is called **Bing Hybrid**. To view other options, select the black  button to see a list of available maps (**Bing Roads / TerraServer Topo / States & Counties / Deep Zoom Layer**).

TerraServer Topo

States & Counties

This layer removes any background imagery and allows several increased zoom levels for easier editing of boundaries.

Note: As part of its effort to map the nation's farms and fields, the United States Department of Agriculture (USDA) has set out to establish the **Common Land Unit (CLU)** as a standardized GIS data layer that will allow mapping to be integrated easily on a nationwide basis. 2009 was the last time they were made publicly available for use.

Segment Area: 82.338 ac

Note: The **Public Land Survey System (PLSS)** is a way of subdividing and describing land in the United States. Most users understand this as the county / township / section of a geographic region. All lands in the public domain are subject to subdivision by this rectangular system of surveys, which is regulated by the U.S. Department of the Interior.

Field Boundaries: Clicking the **Field Boundaries** selection will remove the field boundary displays from the window. Clicking the box again will display the boundaries.

Field Attributes: Clicking the Field Attributes button will display any attributes saved with the field.

Go to Pin: Disregard this option.

If the user wants to display the field sample points from a different (older) dataset, they can just right click on the given dataset, then select the **Display** option.

- The alternate sample points will display in the boundary.
- Repeat the process for any dataset in the profile.
