

The Tortoise and The Hare

This is tortise. Famouse for being Slow. Not to be confused with turtle. Turtles are Semi-Aquatic while Tortises are equiped for living on land.

That's
True.

mmmm.

\$

This IS Hare. Famouse For being fast. Not
to be Confused with rabbit.

Rabbits are social creatures and ^{mainly} live in burrows.

Hares are more solitary and much bigger, stronger, and more athletic.

Sorry.

✂

Now that we've introduced the main characters, we can start the Race.

The Classic Race between the Tortoise
and the Hare. The Turtle and the rabbit can
watch.

LOH, come on!!

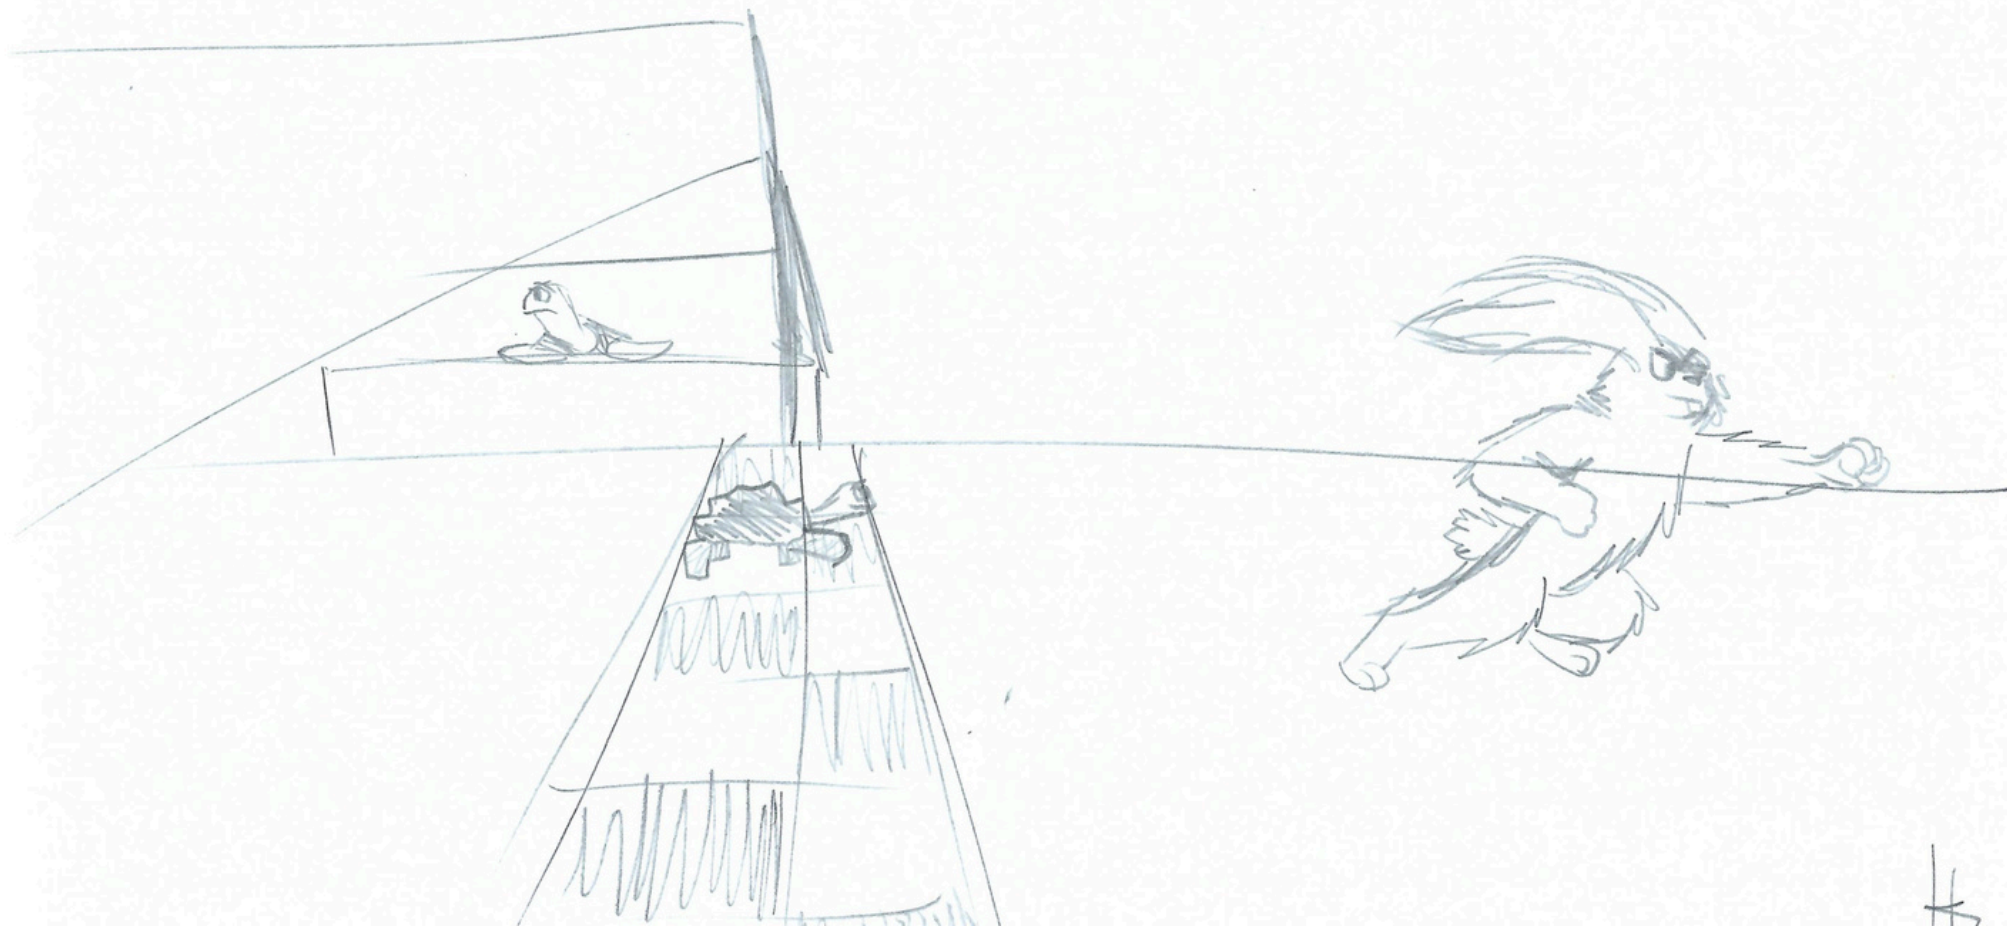

Ready, Set, Go!

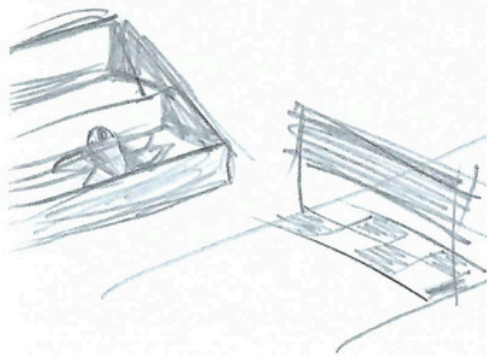

4

And they're off.

As the story usually
goes, The hare speeds ahead.
While the tortoise is
left in the dust.

A hare can reach speeds as high as:
55 mph / 88 kmph. They use the unique shape
and size of their
legs to reach
these speeds.

A Tortoise Tops out at Approximately:
.62 mph / 1 kmph. Tortoises are better
known for their strength. Mathematically,
Tortoise is No match for
Hare.

The one Problem IS that hares
are better at Sprinting rather than
Running. They require frequent Stops.

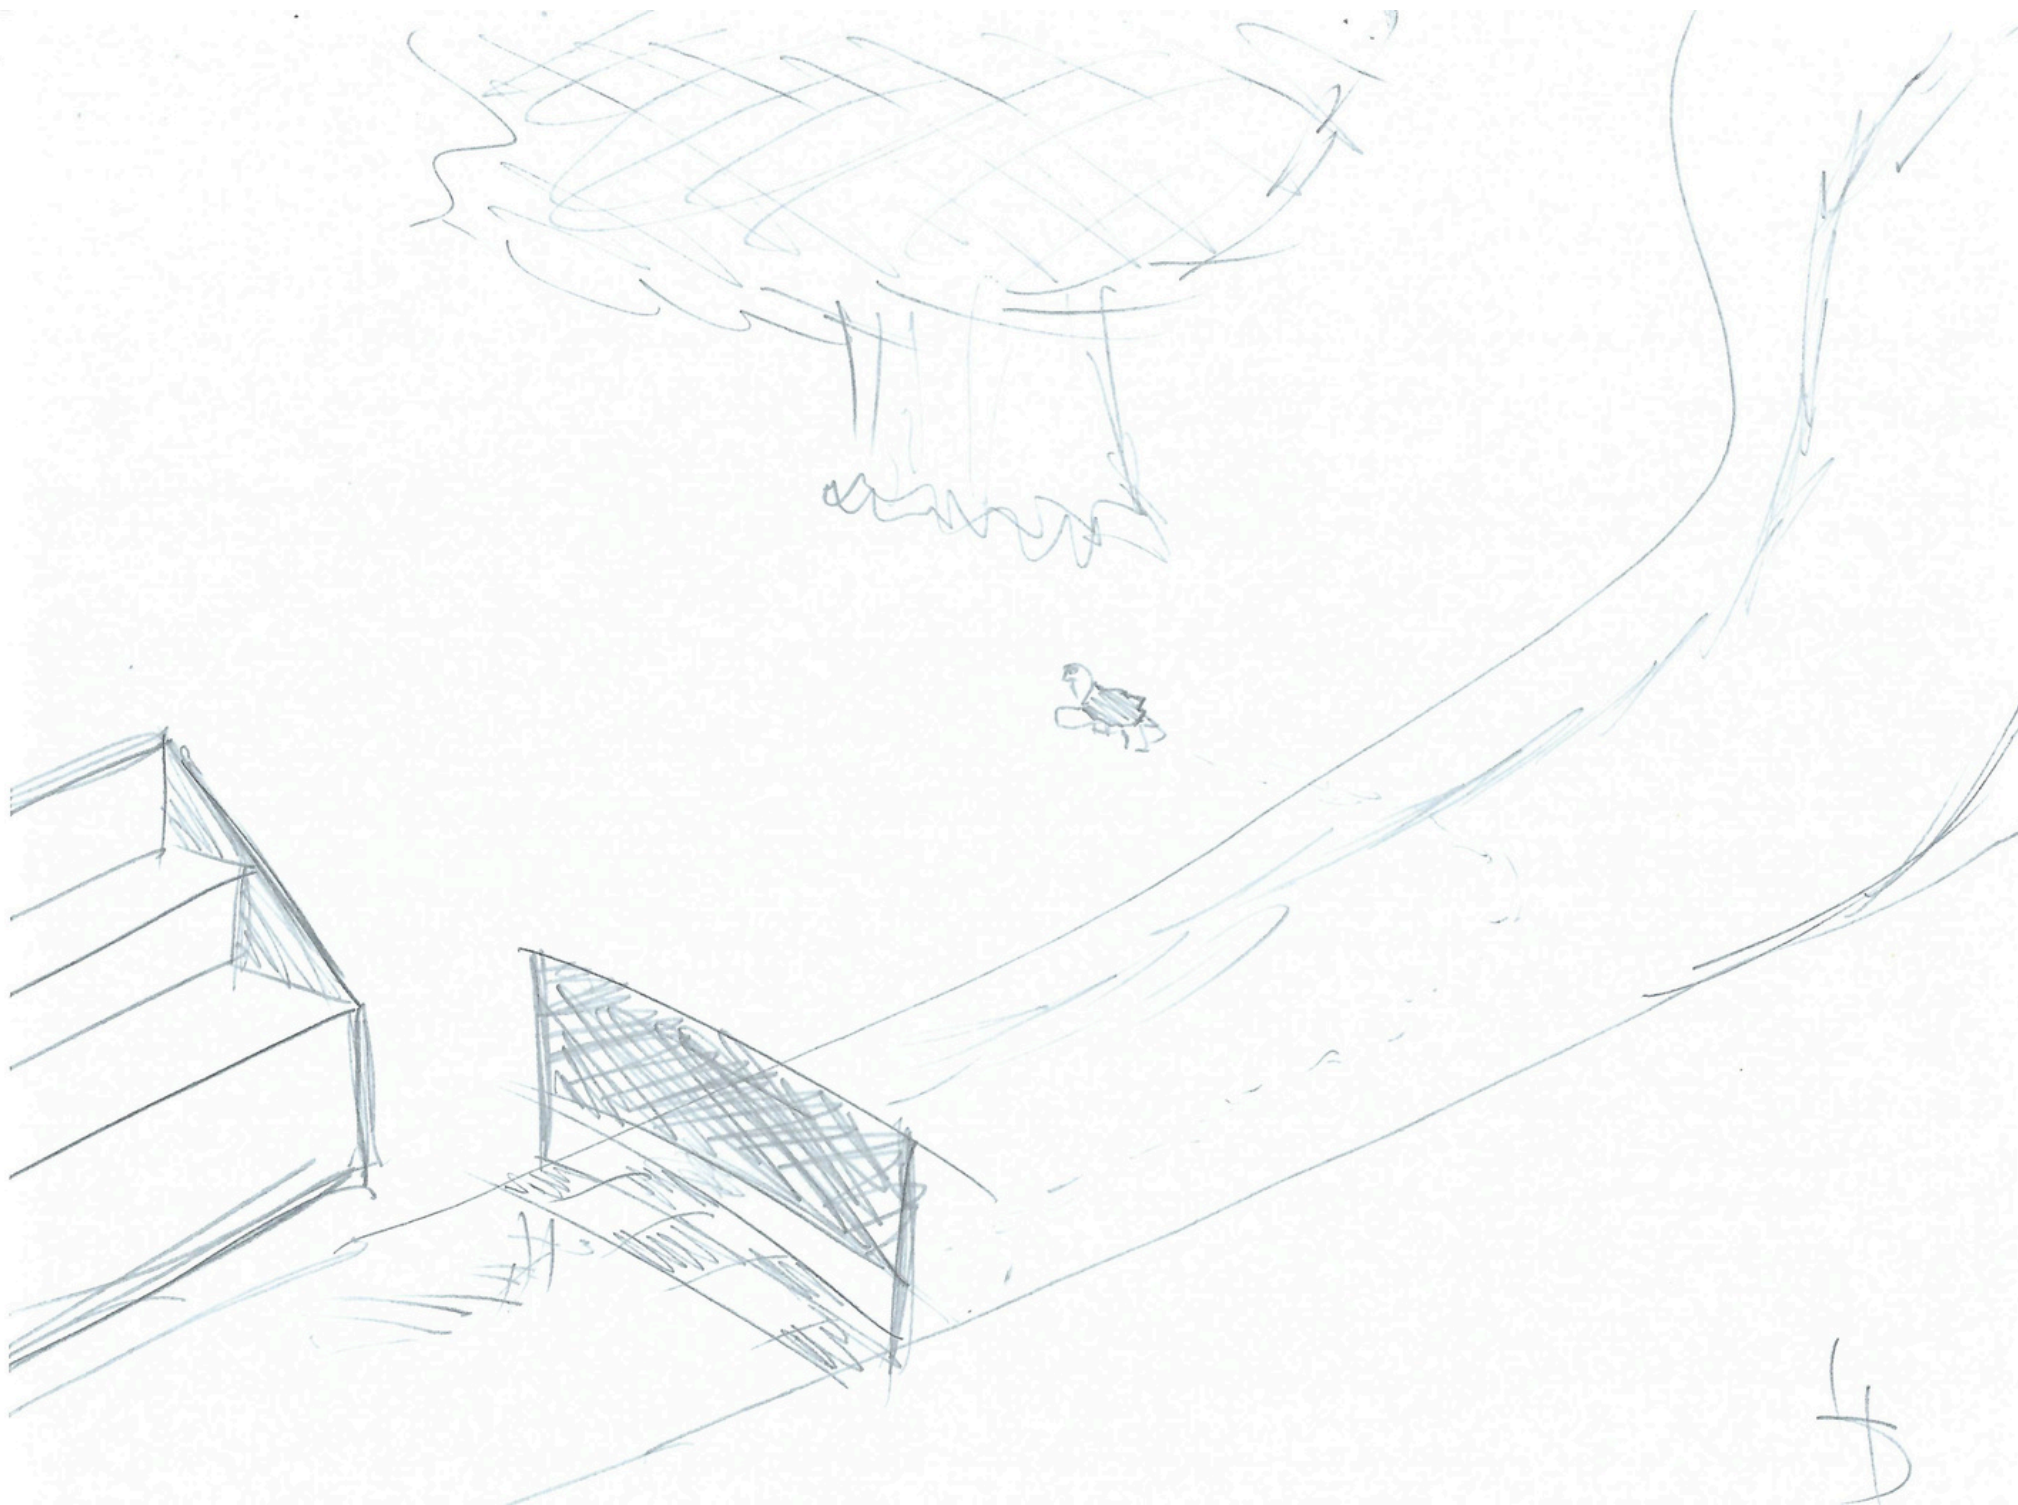

+

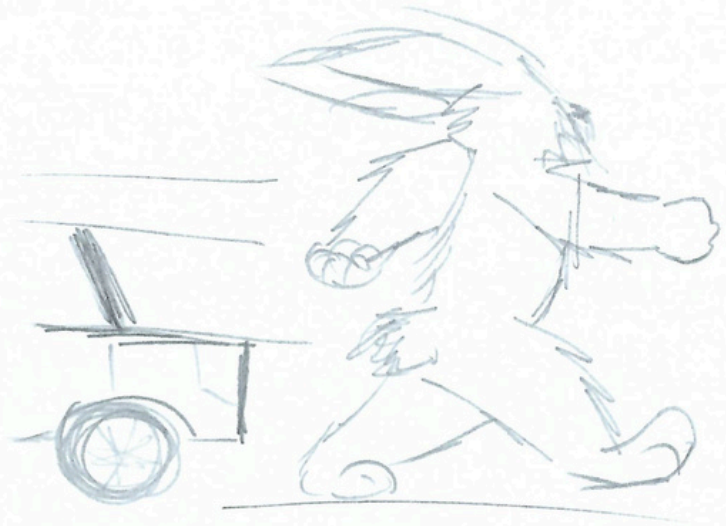

But, even with that feature, Tortoise is unlikely to beat hare.

4

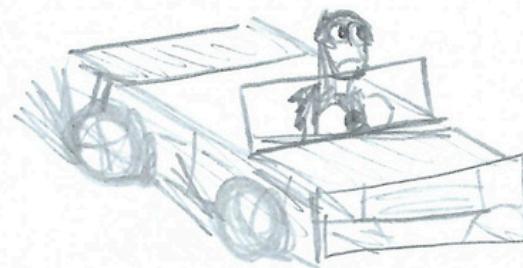

No
Rules!

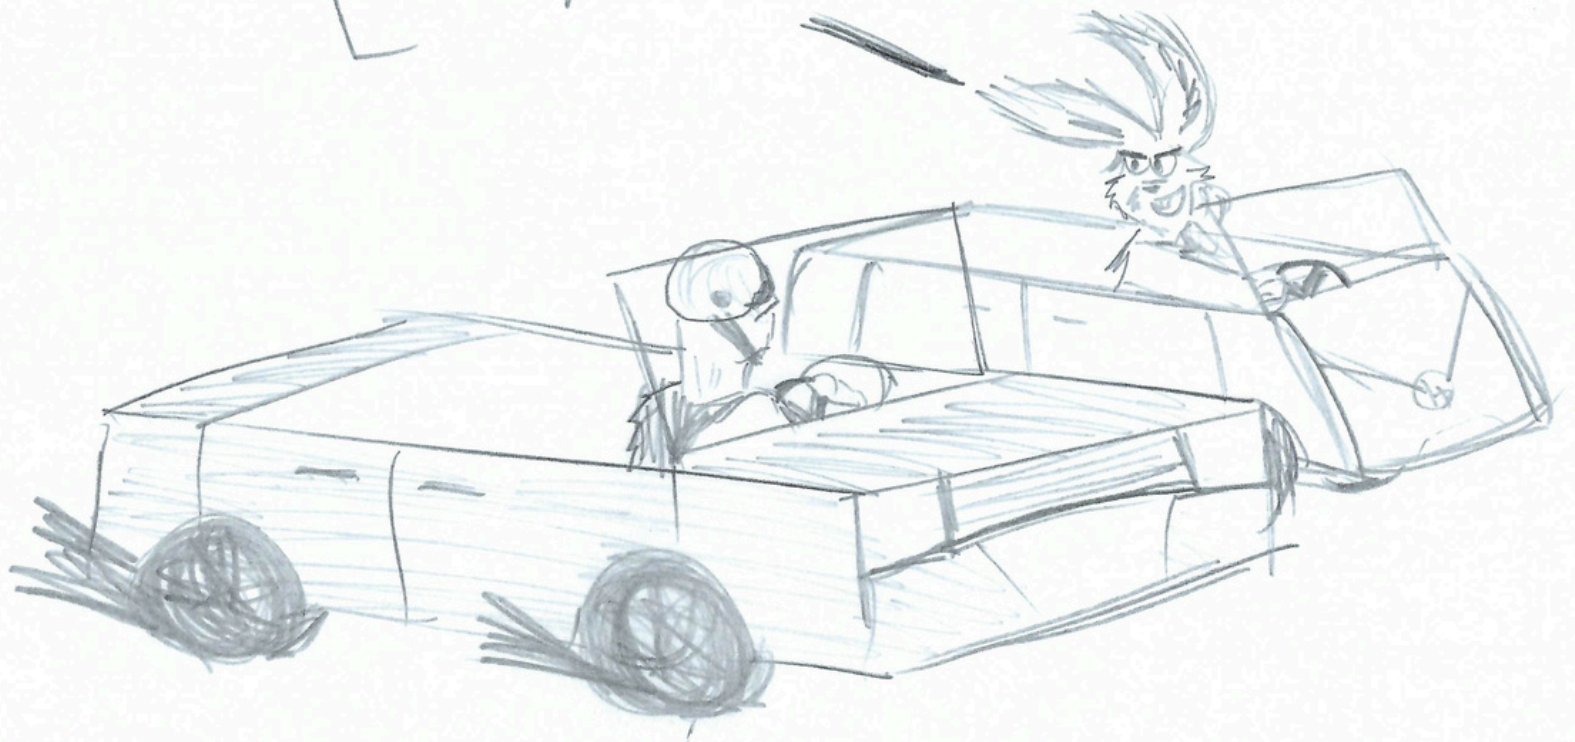

Really?

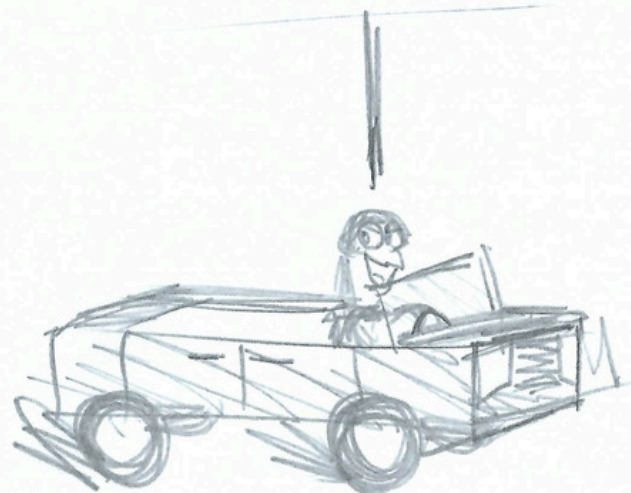

f

Electric Motors have Higher
Torque Than Combustion engines!

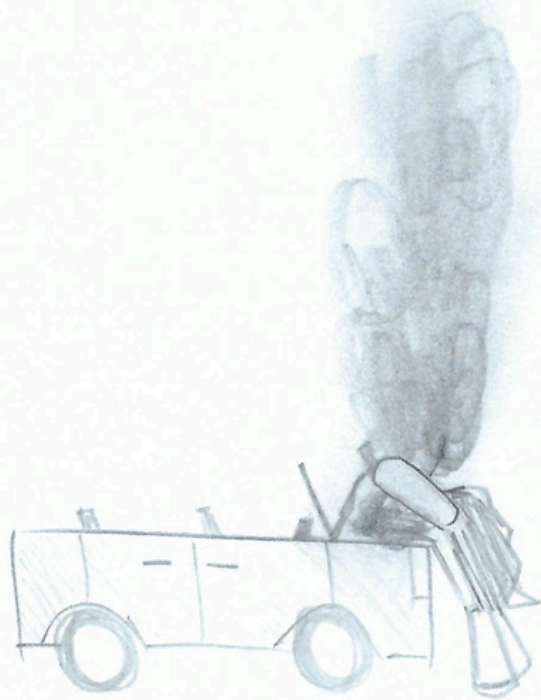

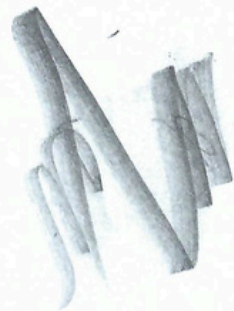

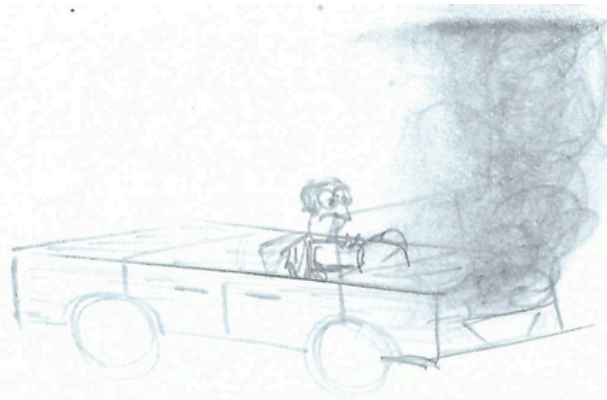

4

「yeah, but gasoline
has more range!」

4

What
Happened?
?

What Happened?
What is all this,
Anyway?

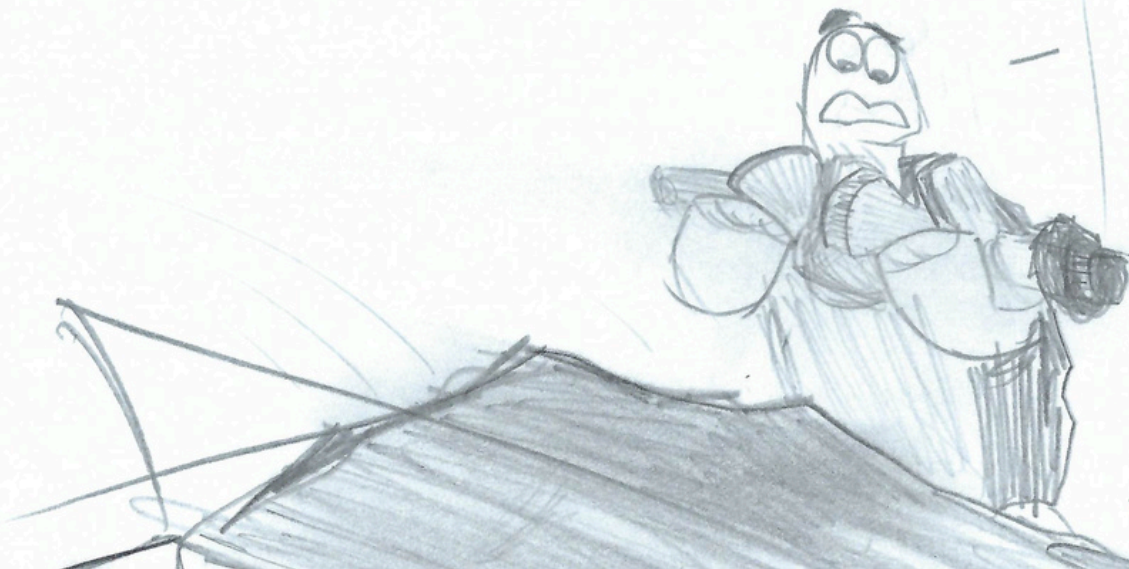

Who knows?

Cars with engines
Are so complicated
There are so many
Parts that have to
do everything perfectly

I found the
problem.

Whatever this
was wasn't
Attached to
anything on
one end.

CLANK!

That looks like
The Crank-Shaft.
That's the part
That's attached
to the Pistons. It
transfers the energy
from the Pistons
to the gearbox.

#

Well that
solves that,
then.

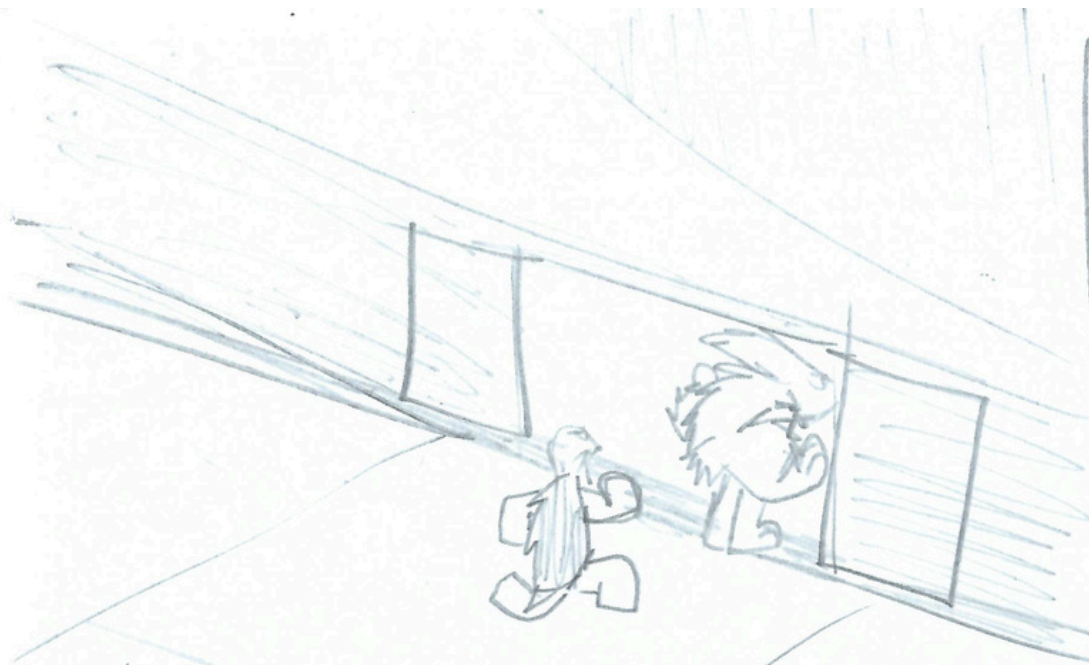

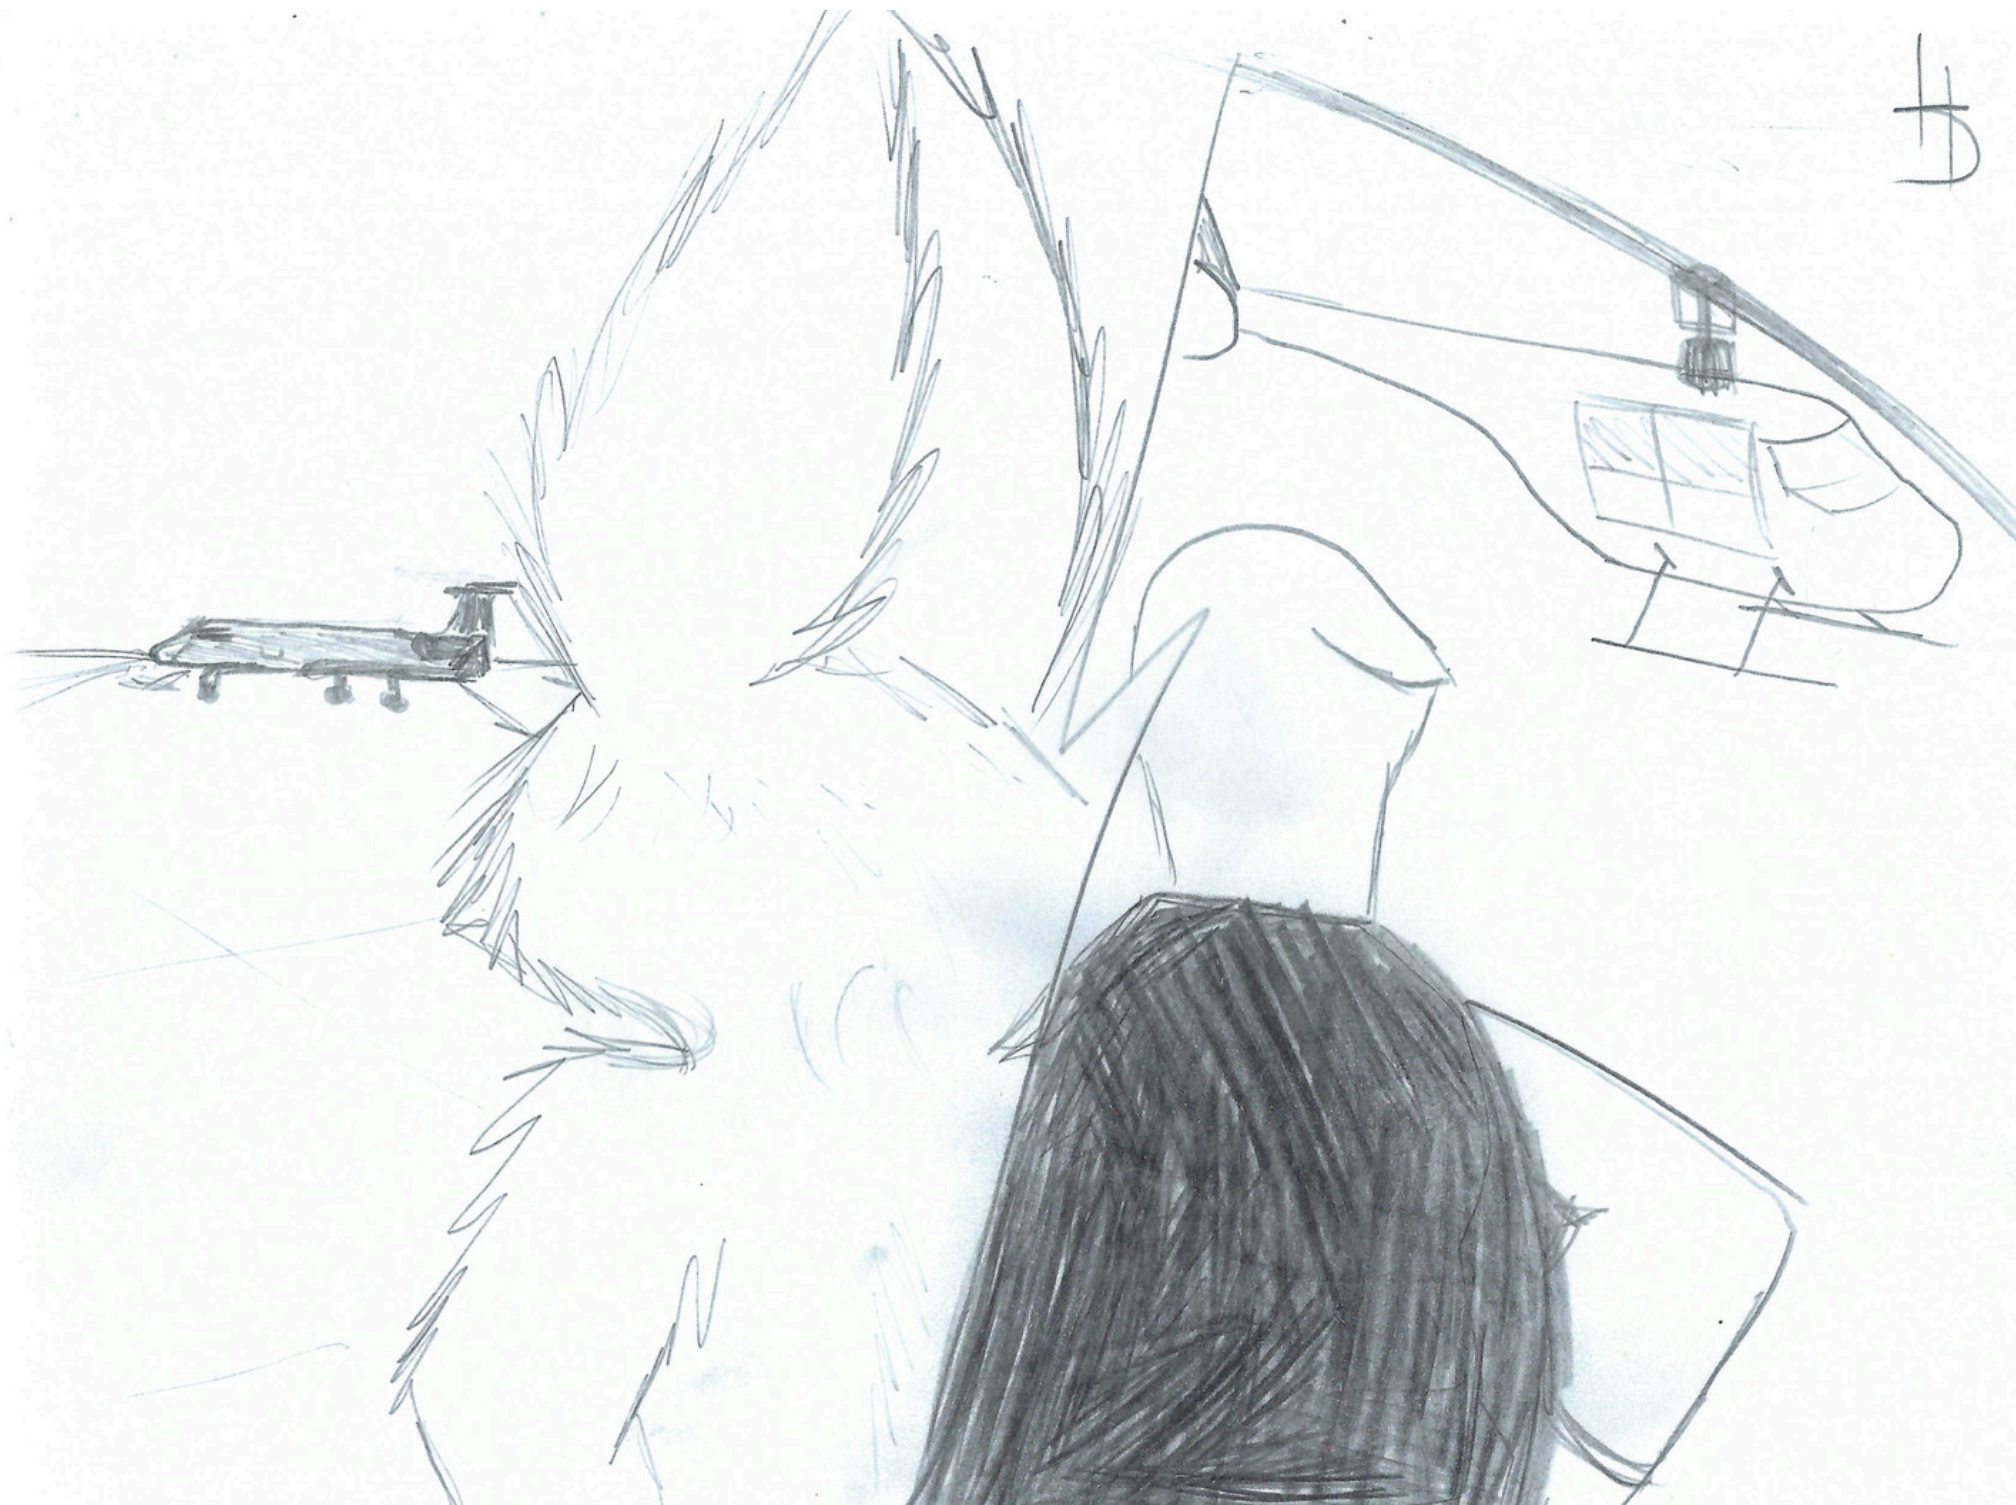

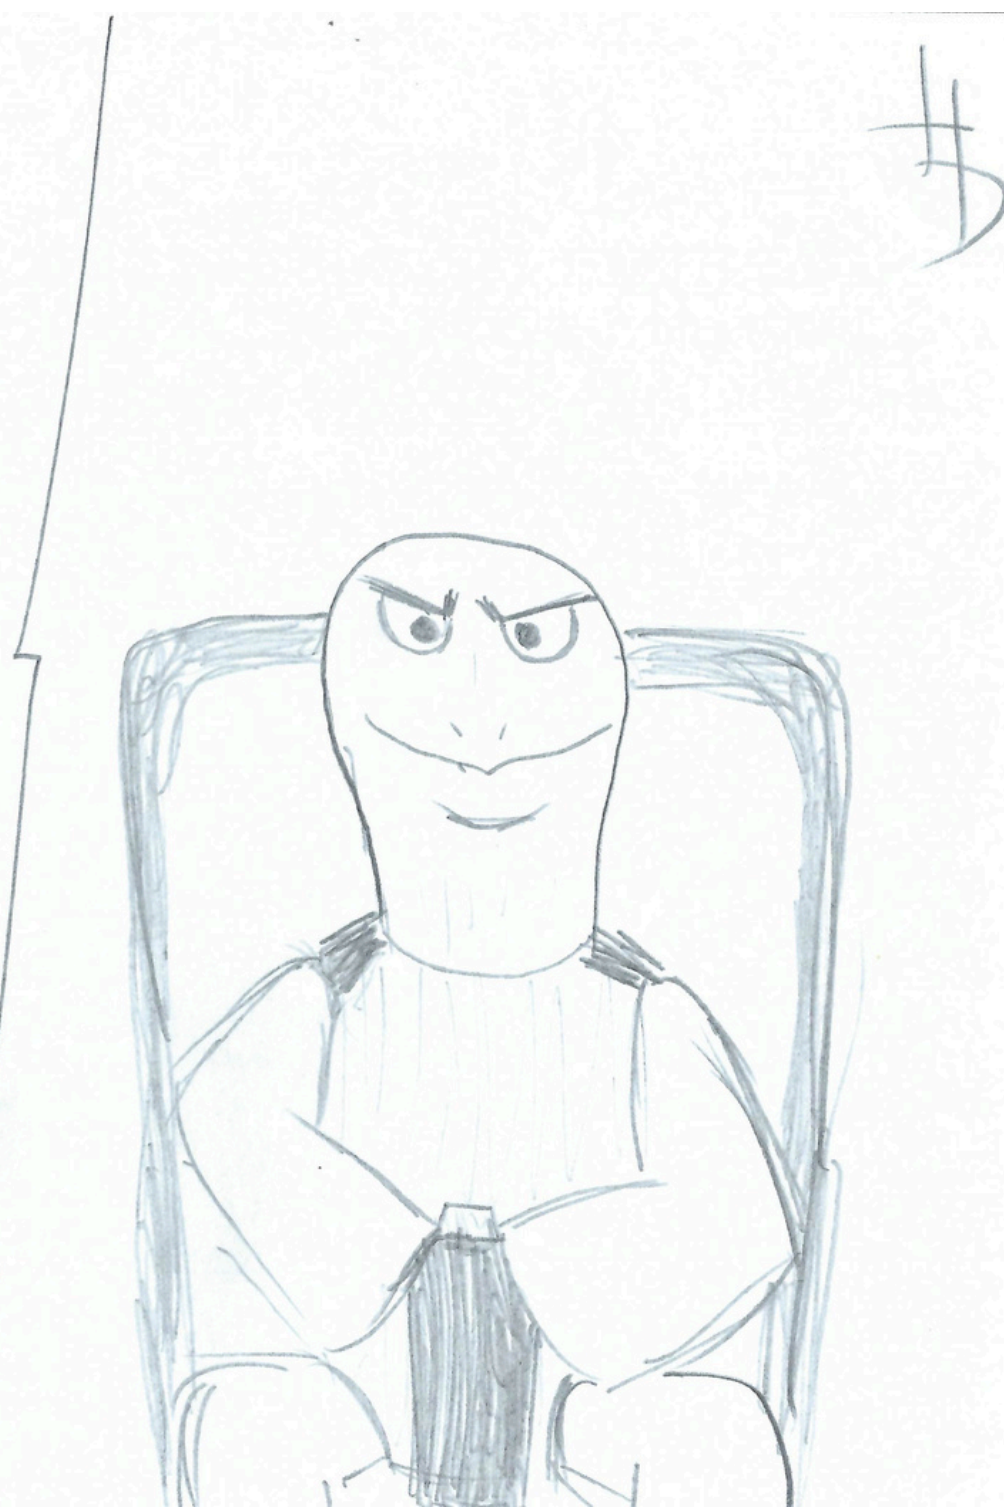

what Now?

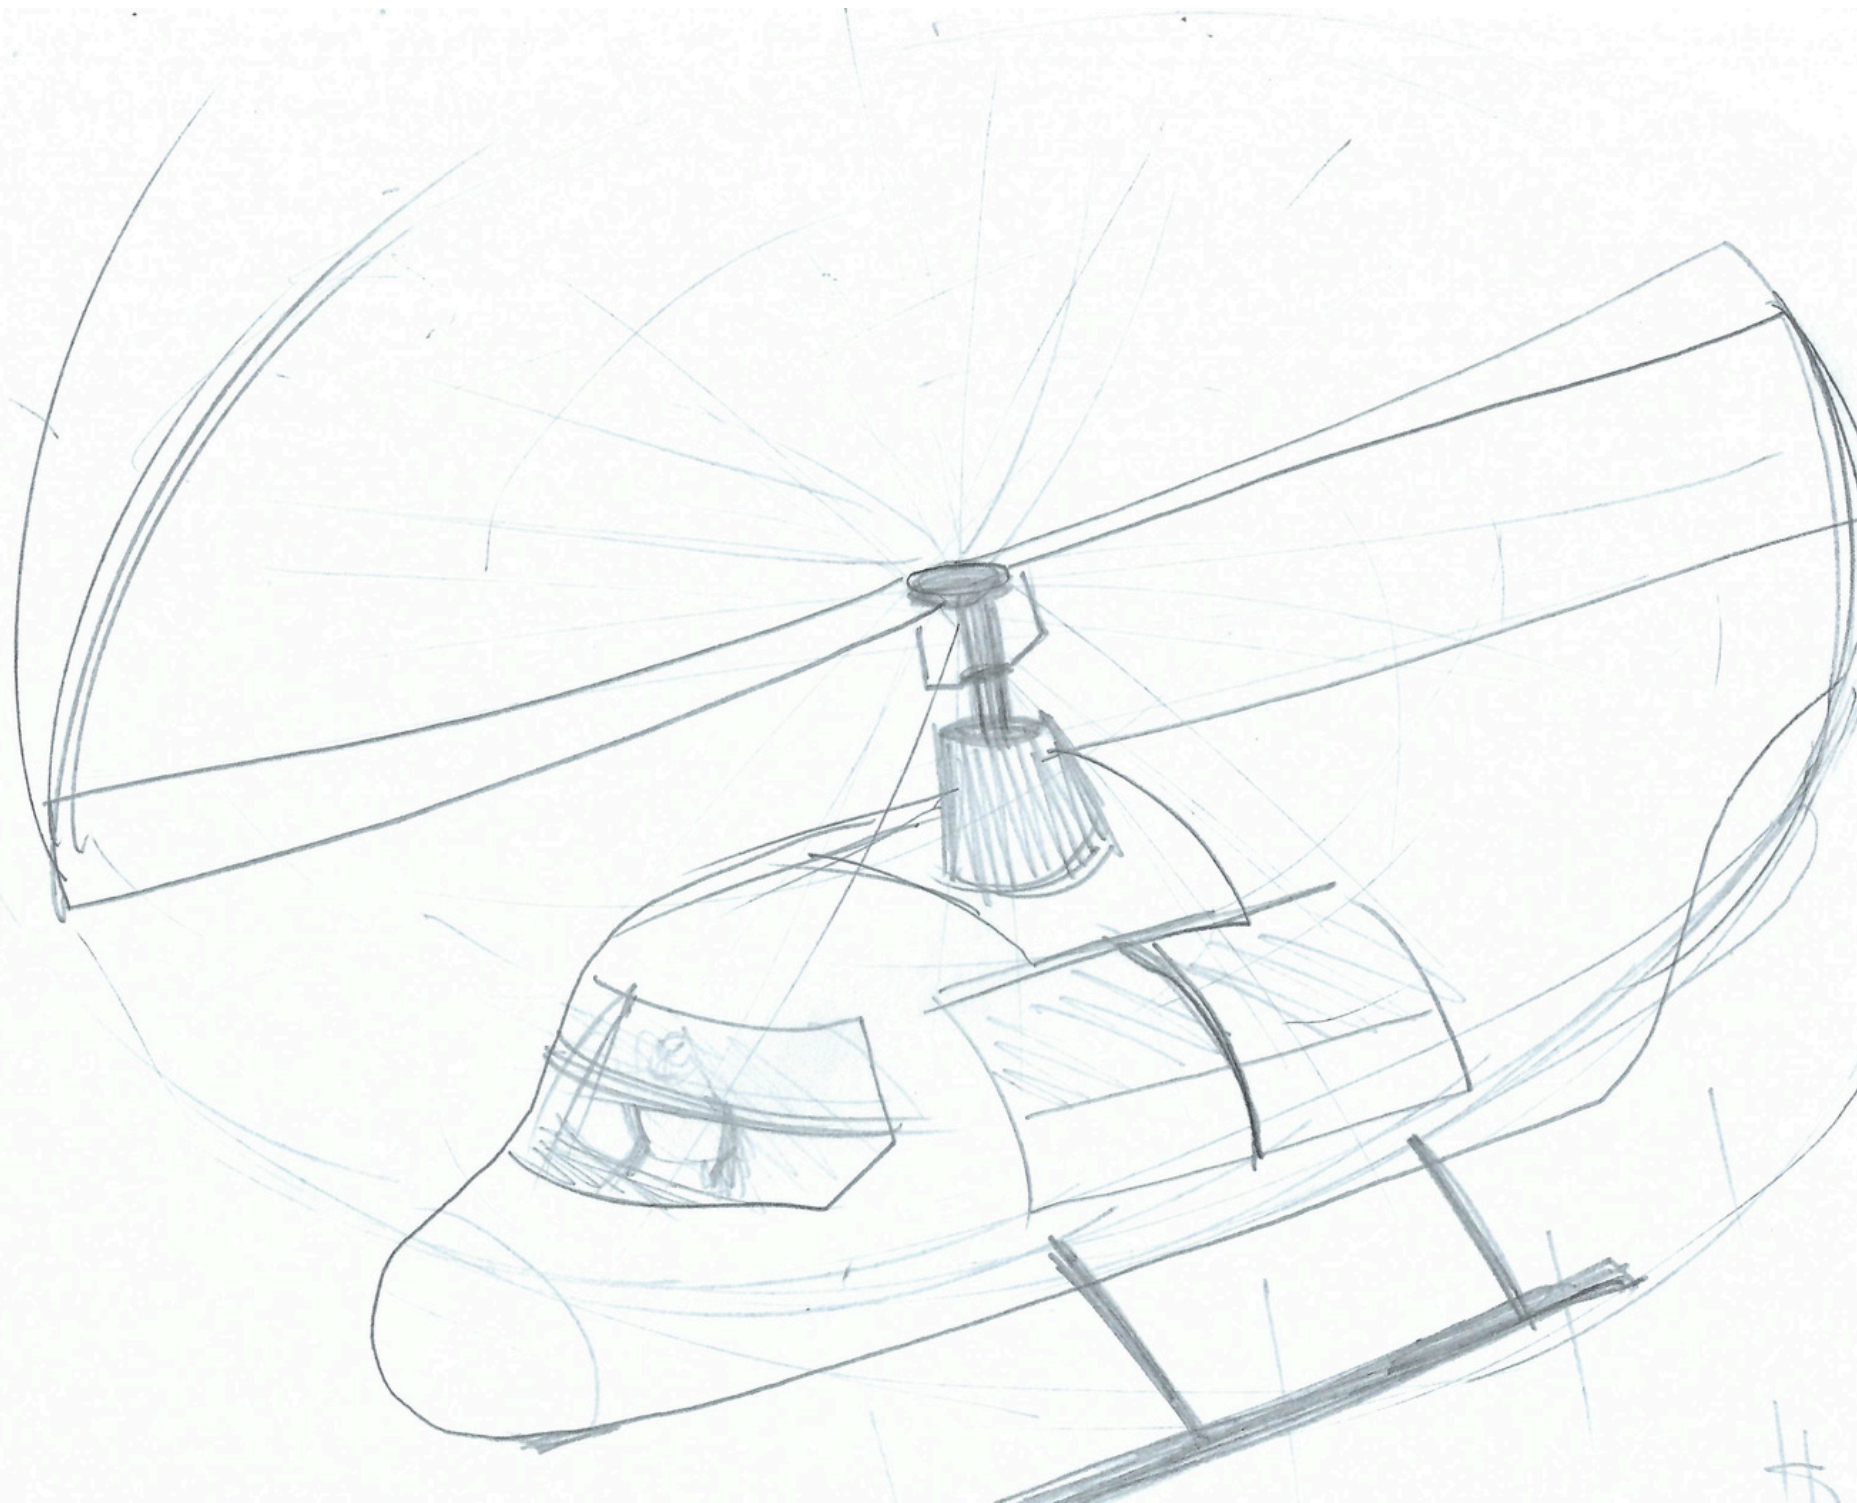

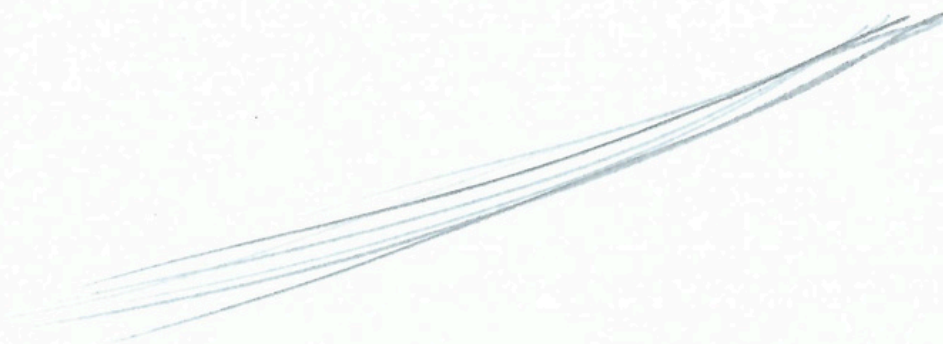

+

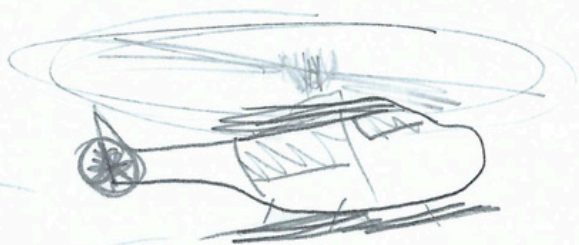

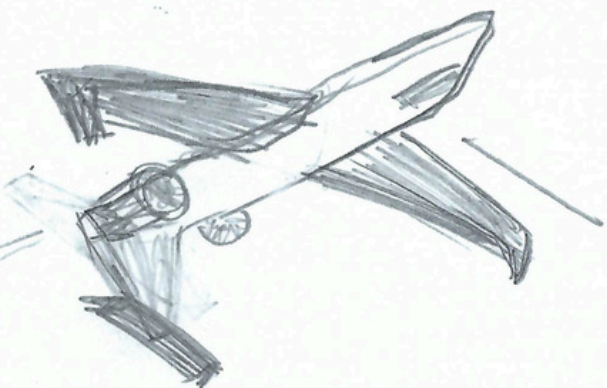

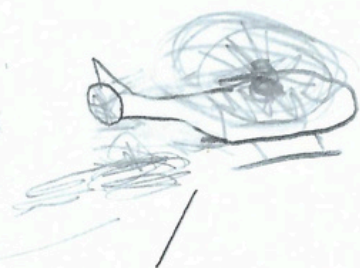

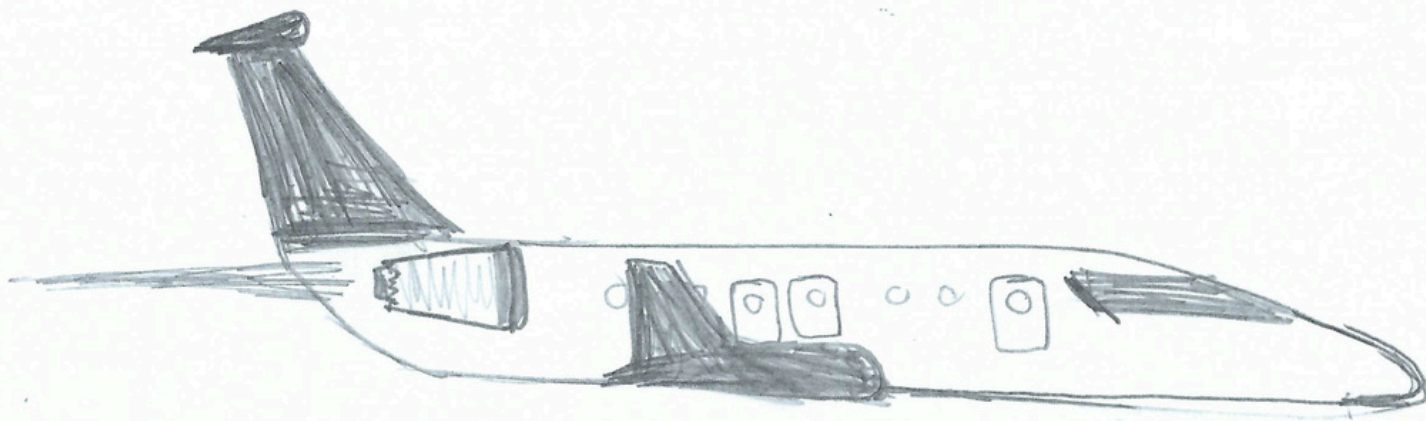

4

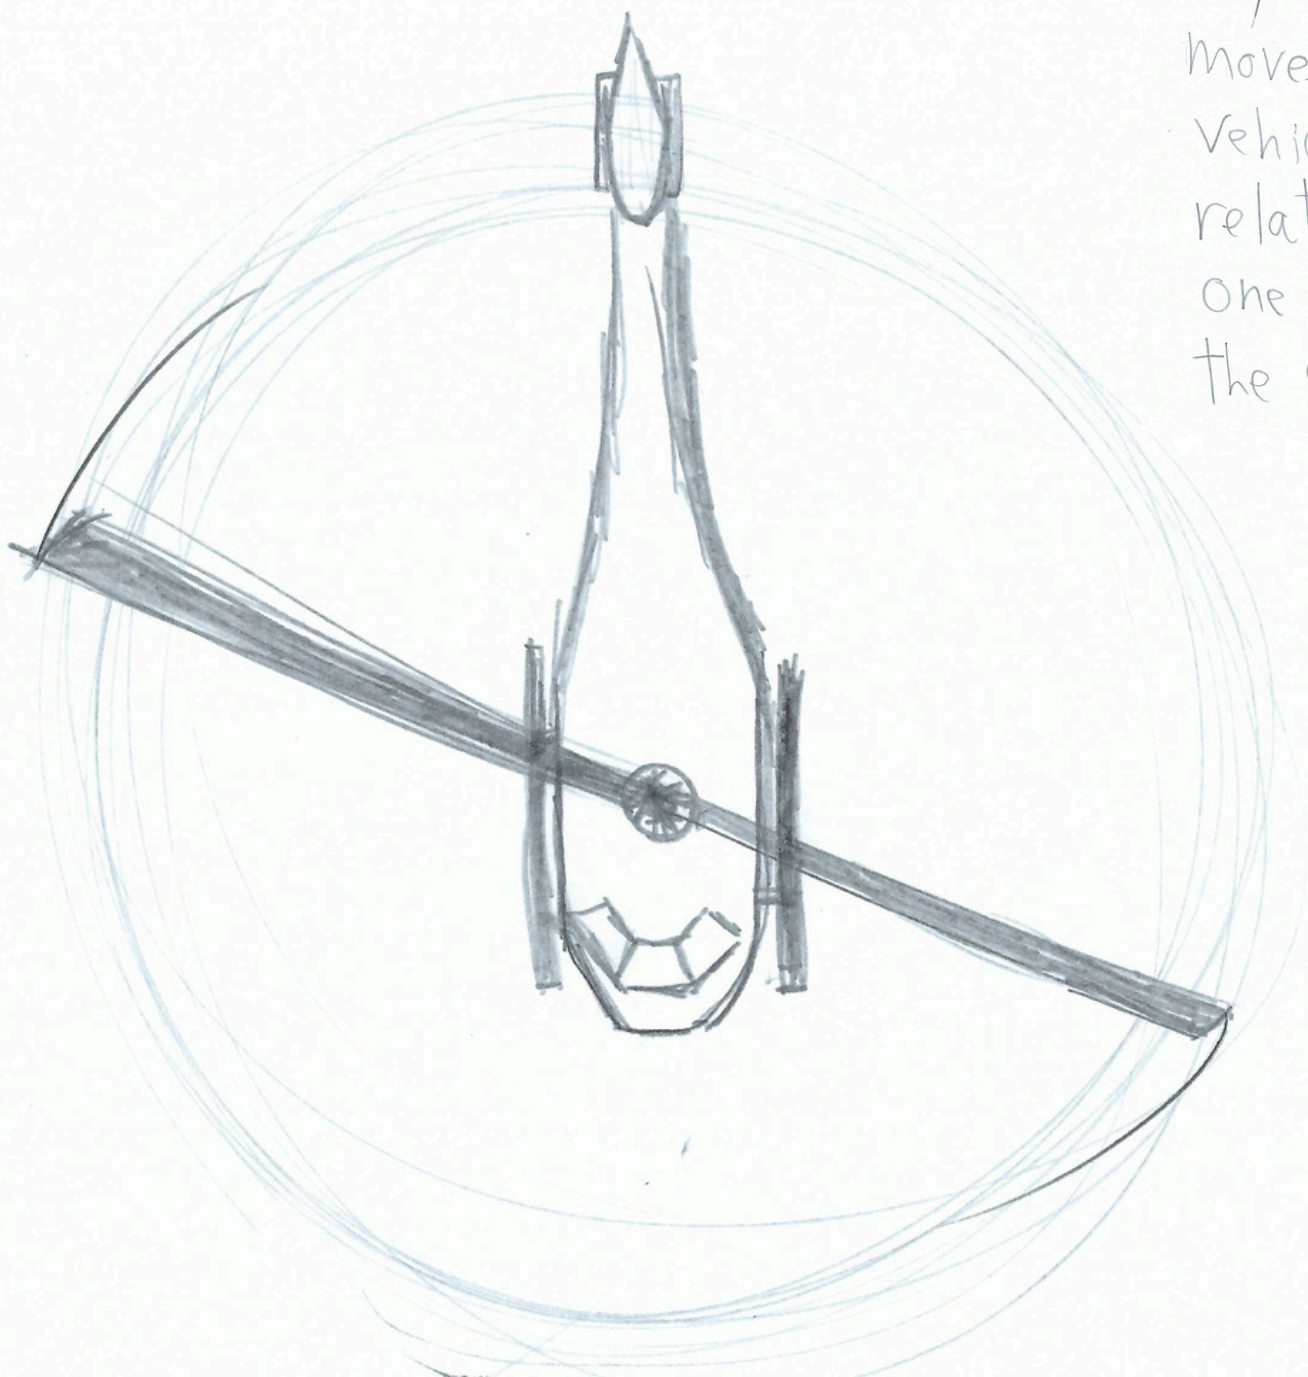

How are you going
So fast?

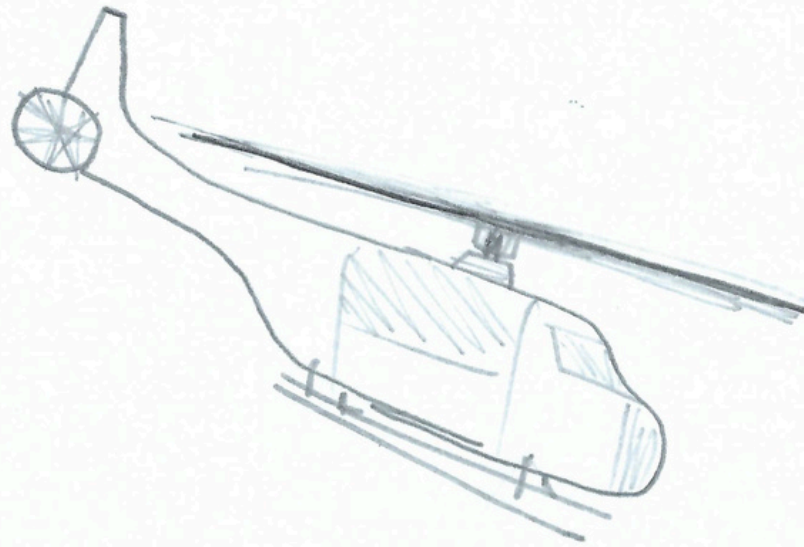

It's mainly because I'm flying
a fixed-wing Aircraft.

While Traveling forward at any given moment, one blade moves forward relative to the vehicle and one moves backward relative to the vehicle. Therefore, one blade travels faster through the air than the other.

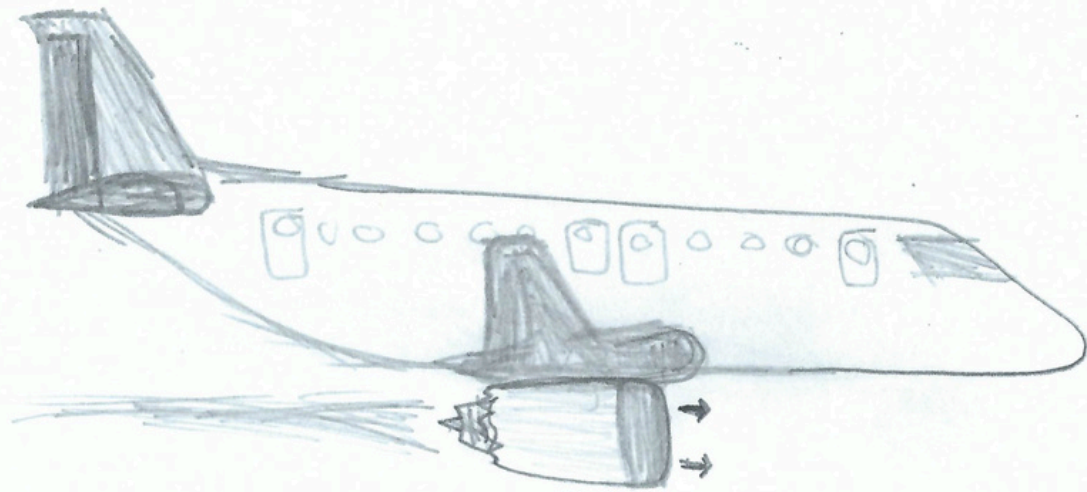

This Causes One Side to have more lift than the other; which causes a tilt.

That means the helicopter needs to work harder to maintain stability.

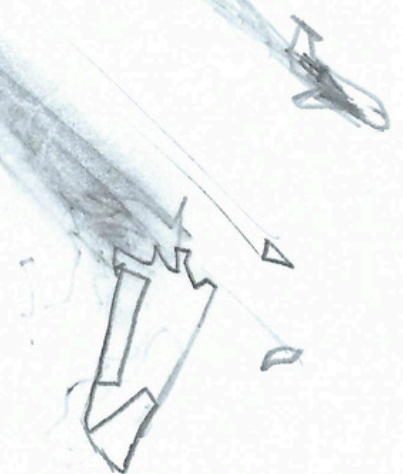

An Airplane can maintain Stability at higher
Speeds. Since all the blades maintains equal thrust

H

Hey!

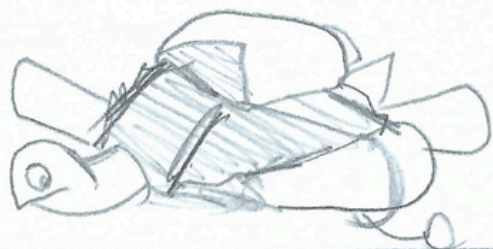

45

「Not
Cool」

4

Hey! How come
you're able to
steer. It's
a
Parachute!

Because, This
version has steering lines
that I can use to increase
resistance on one side
or the other.

Yours just catches air
In one direction

So, It Just
Slows you
down.

yeuh.
I Guess

「Where are you going
Now!

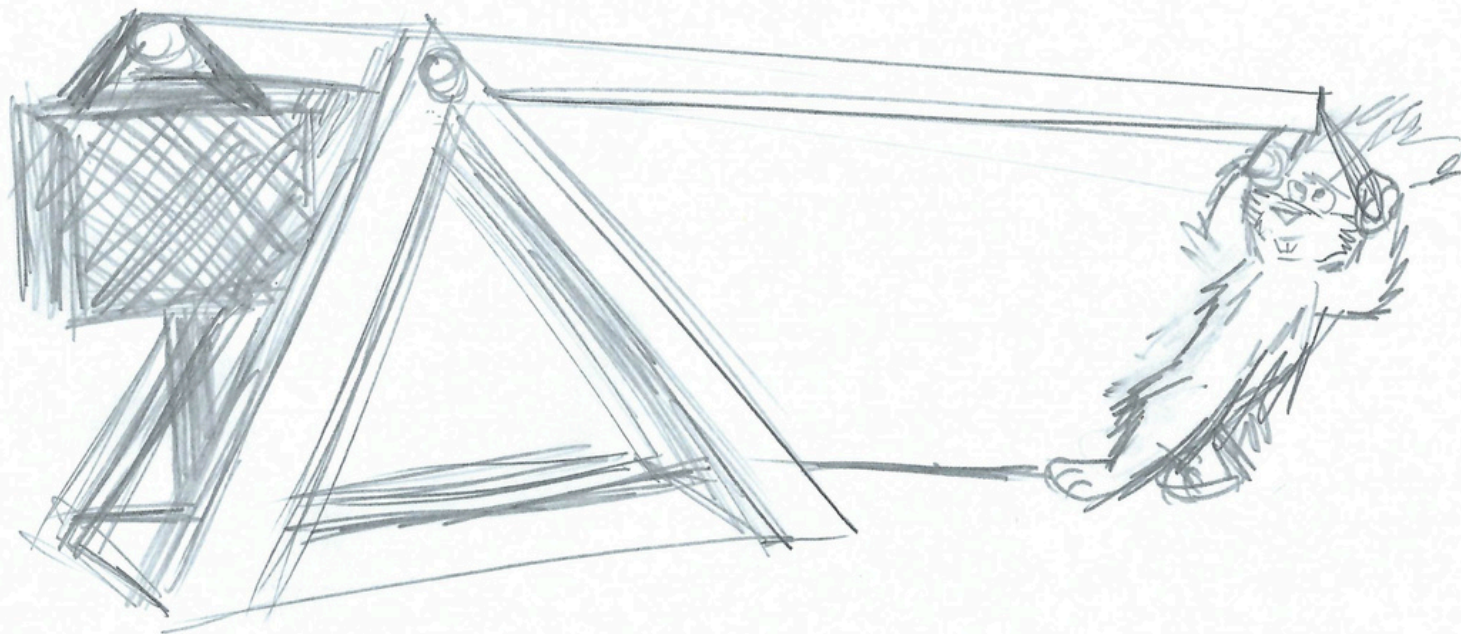

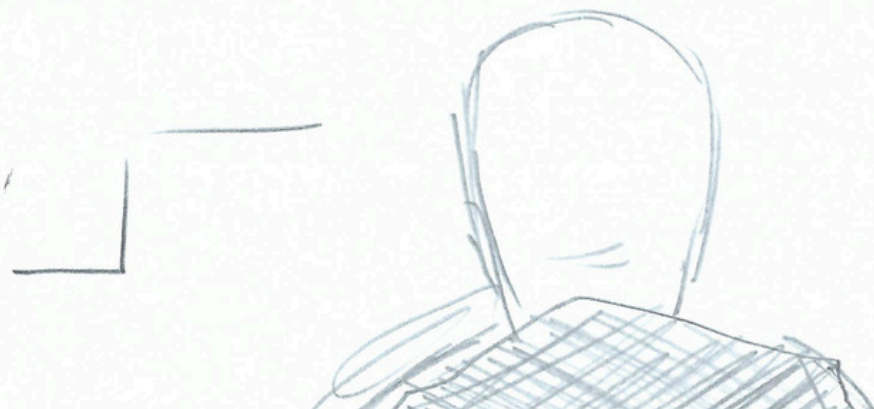

Even after all those
random detours, I'm still
going to beat you!

you've got
to be kidding
me.

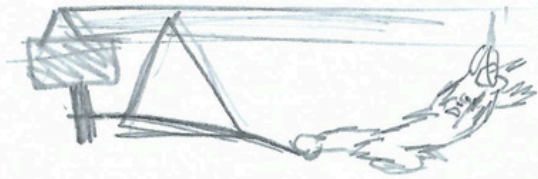

「What's with the
catapult?

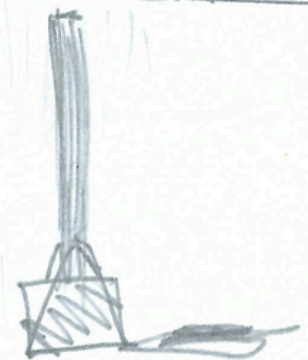

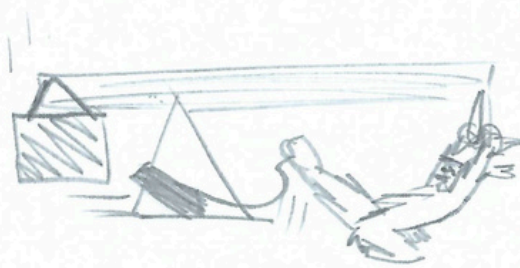

+

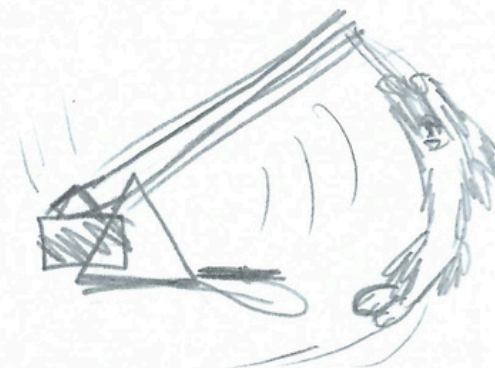

This is a Trebuchet.

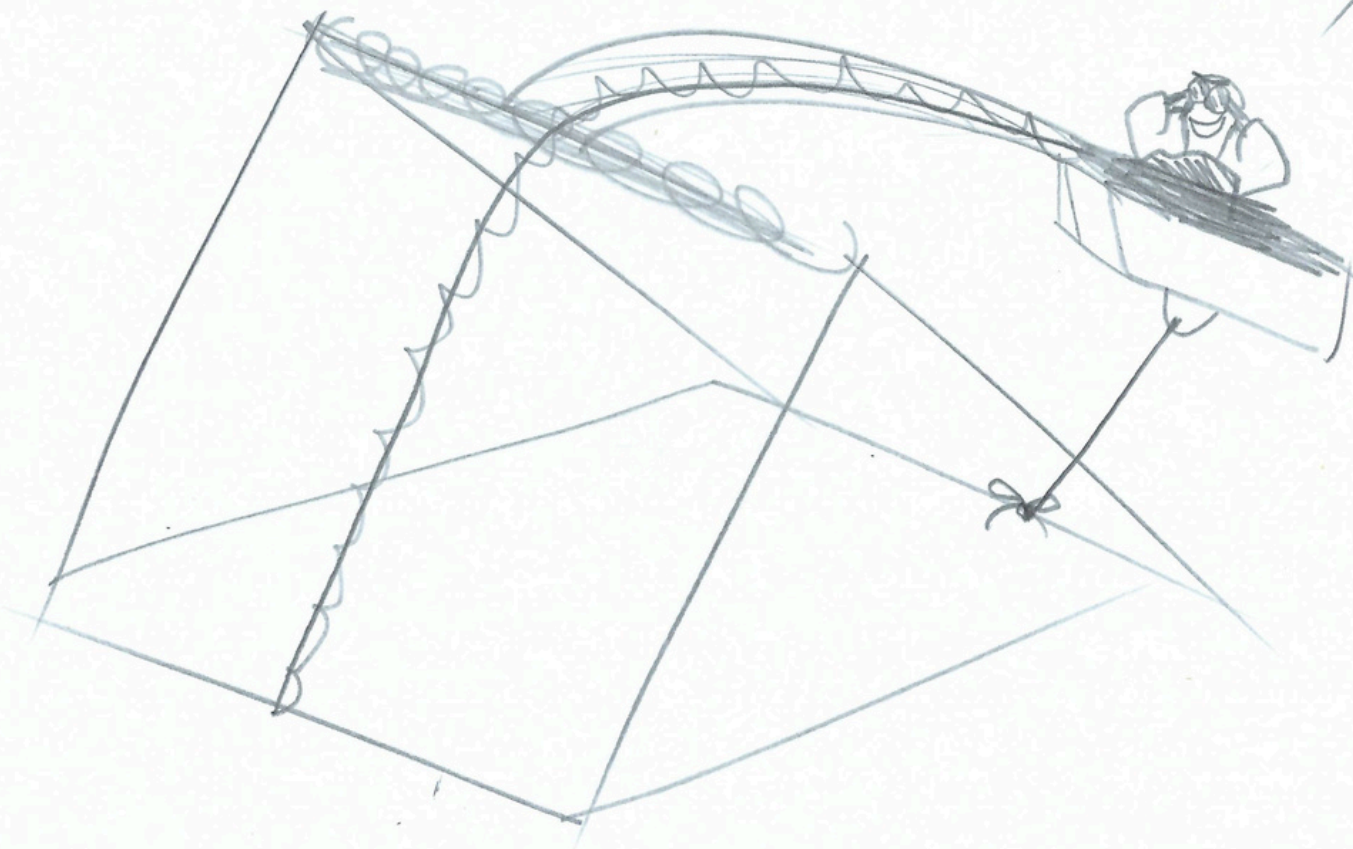

The catapult is over there.

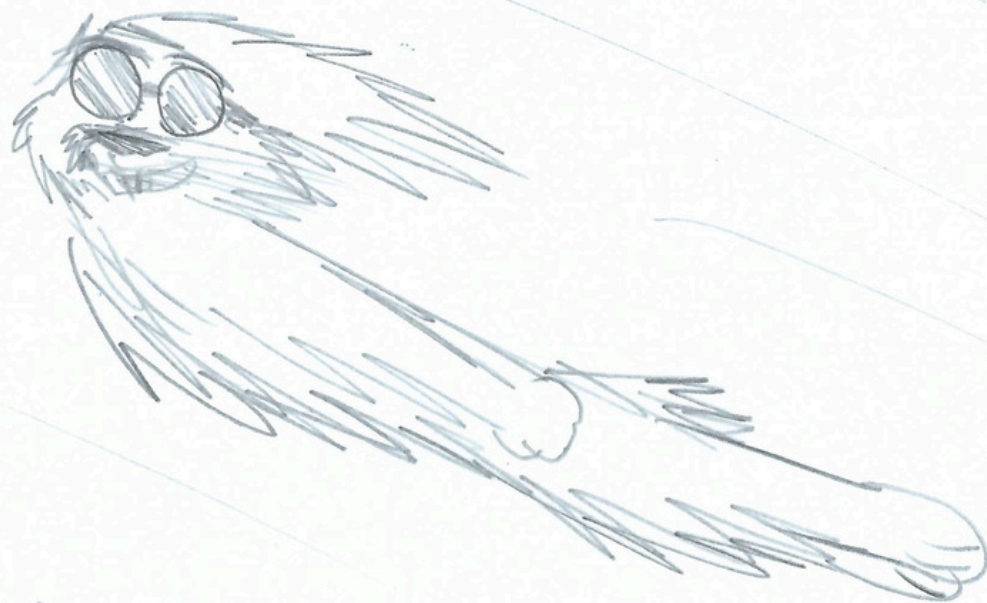

#

[Here We go
Now]

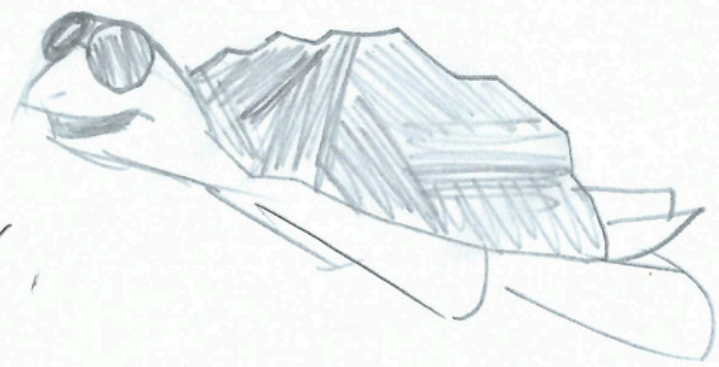

+

Can't catch
me now!

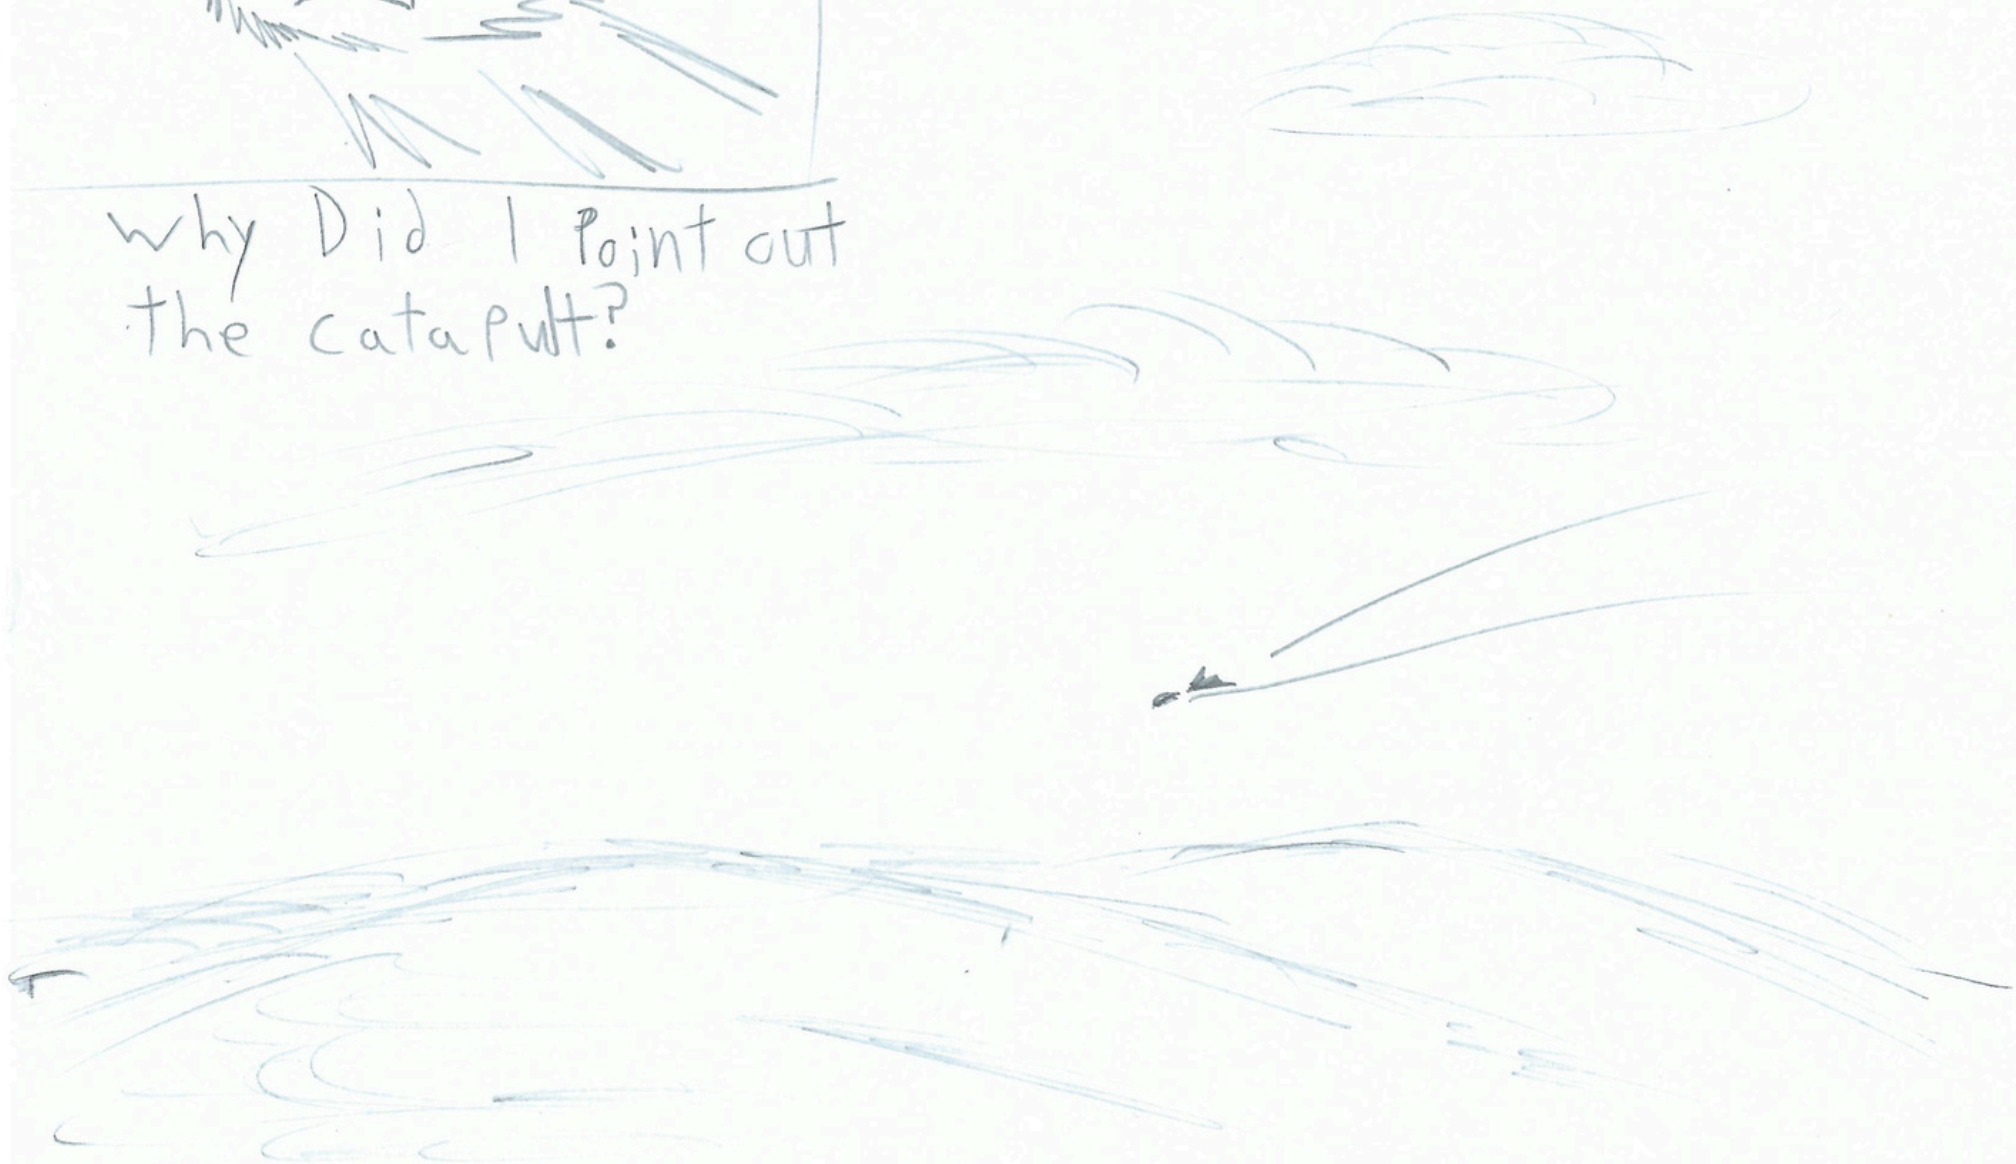

11

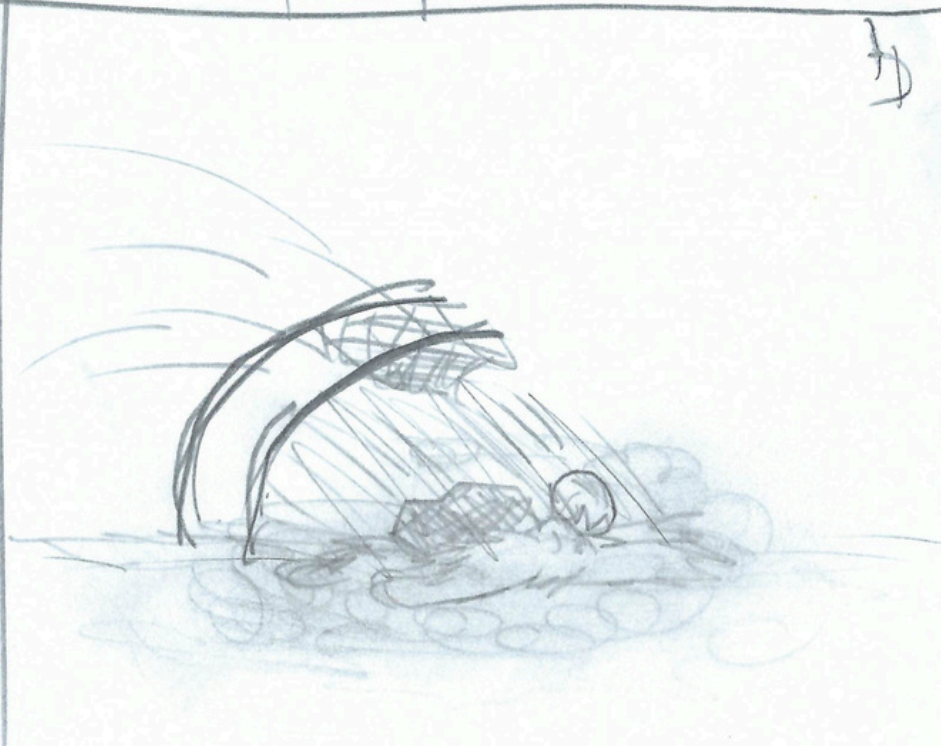

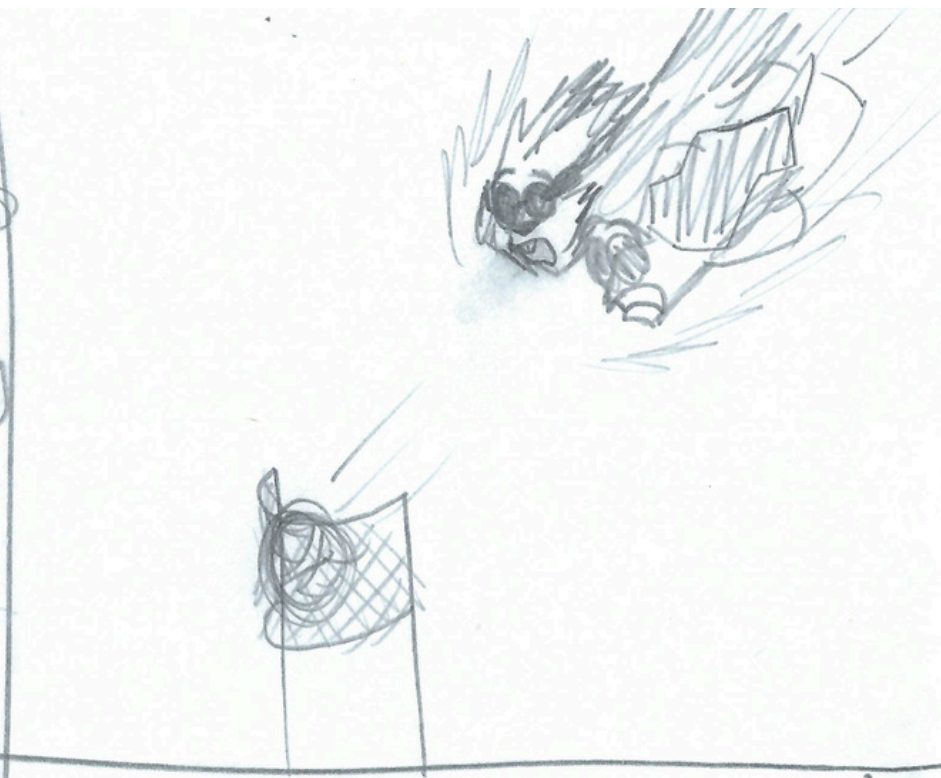

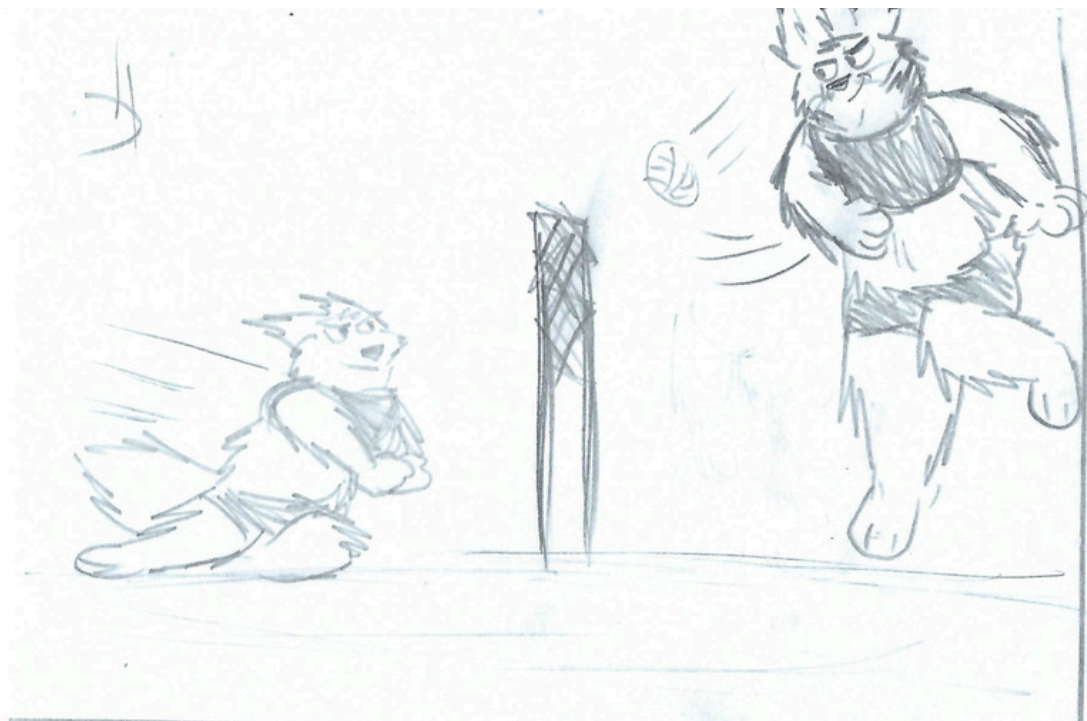

[Hello.]

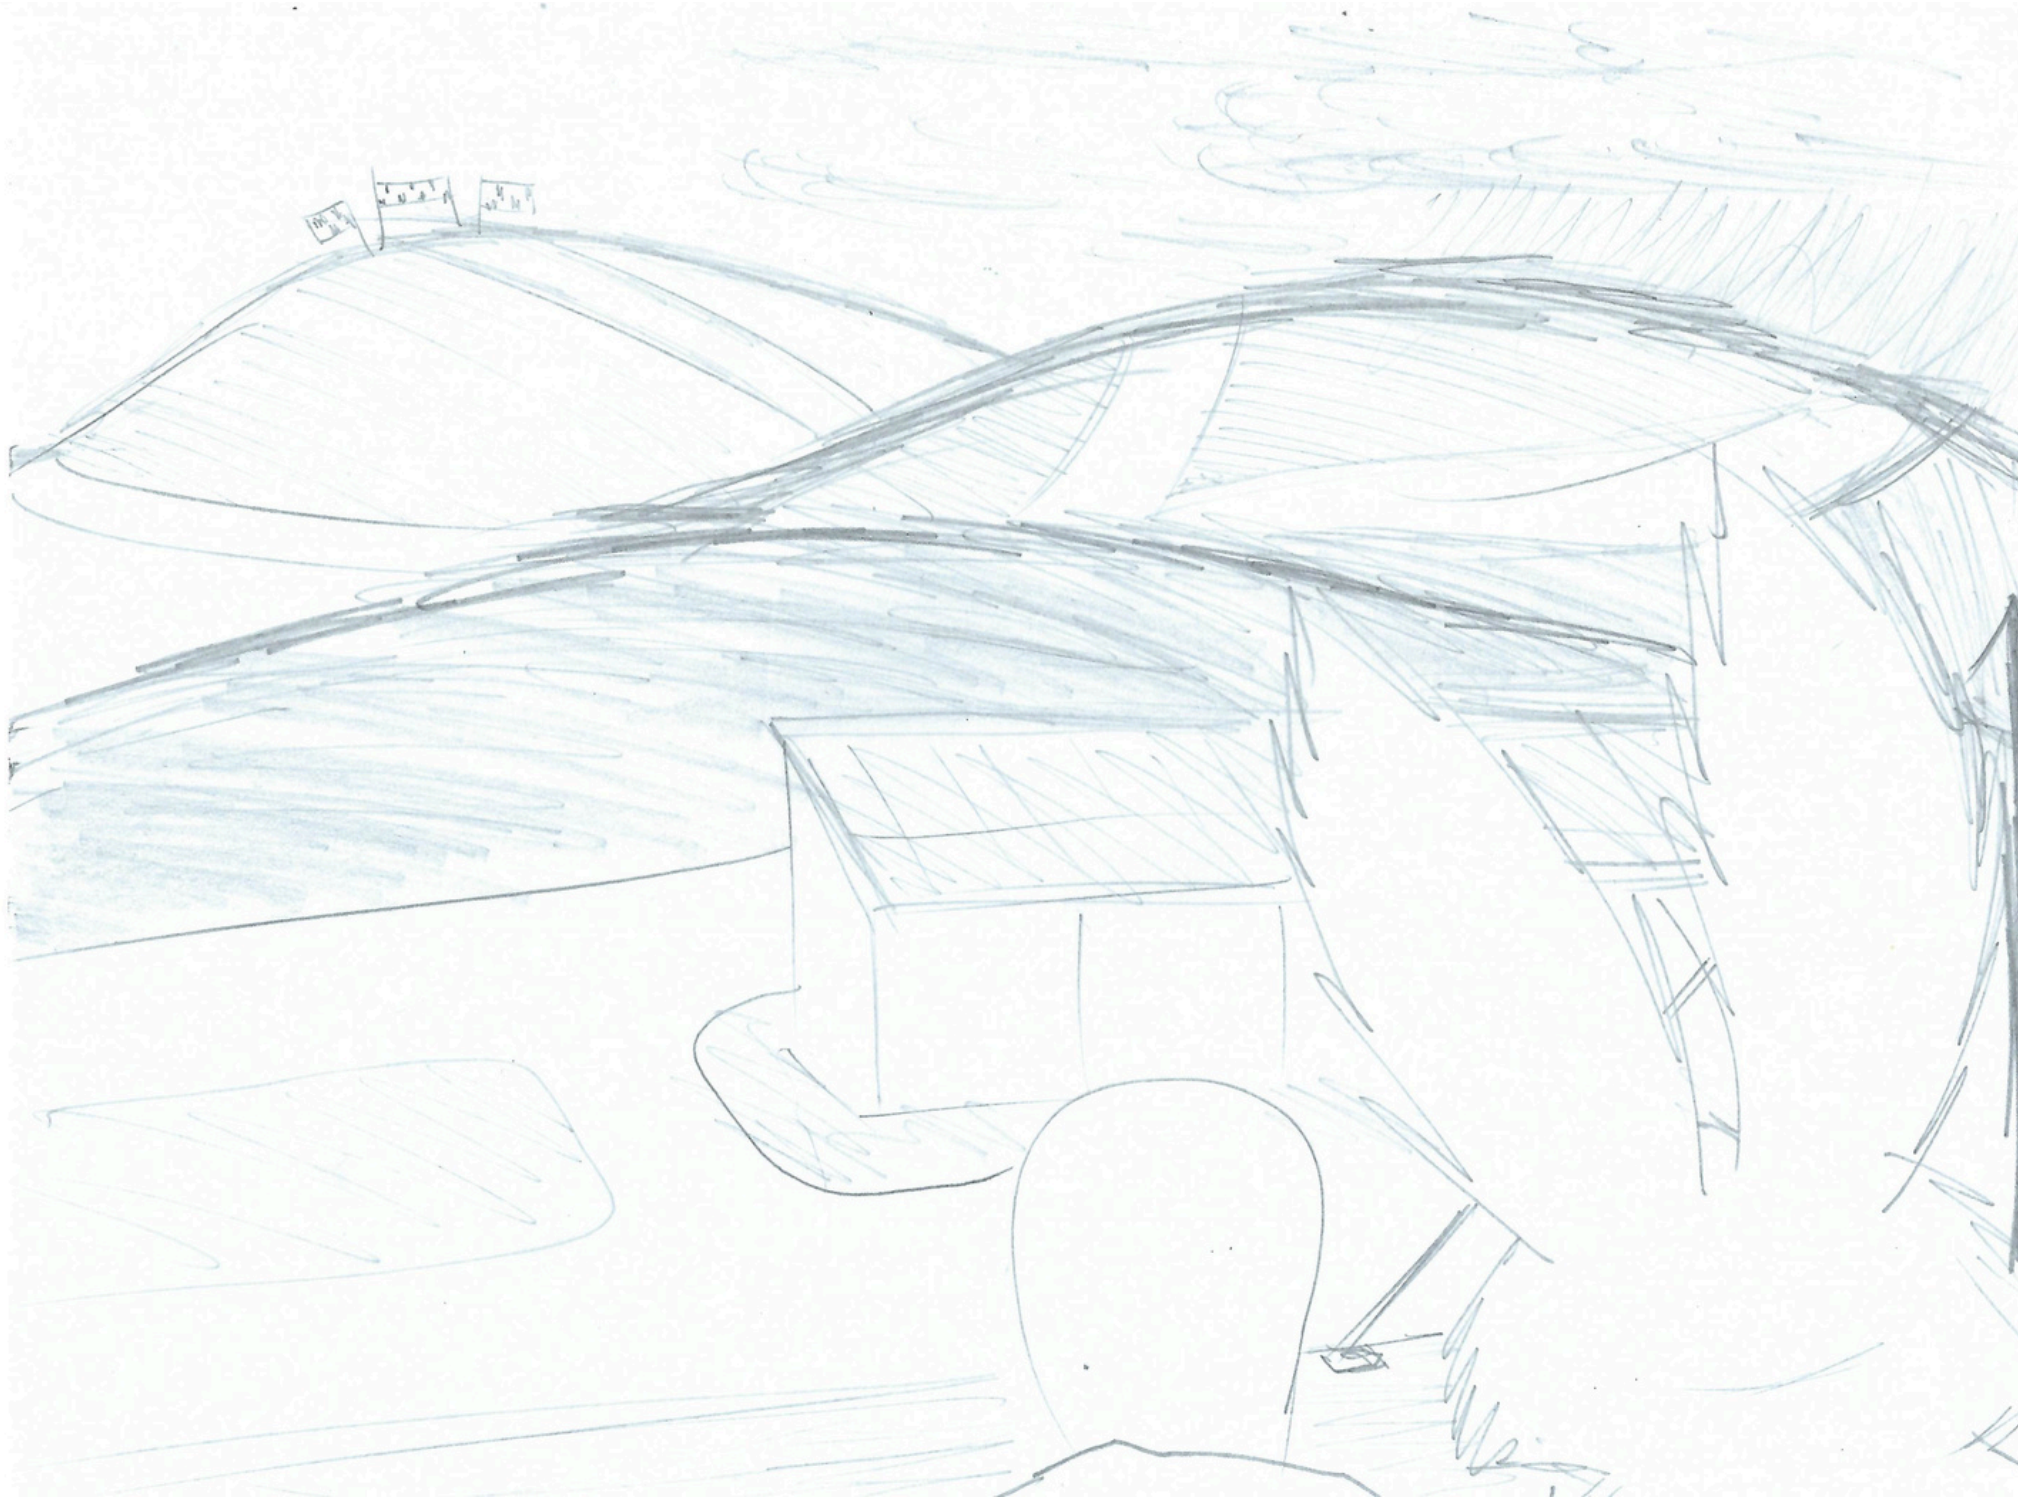

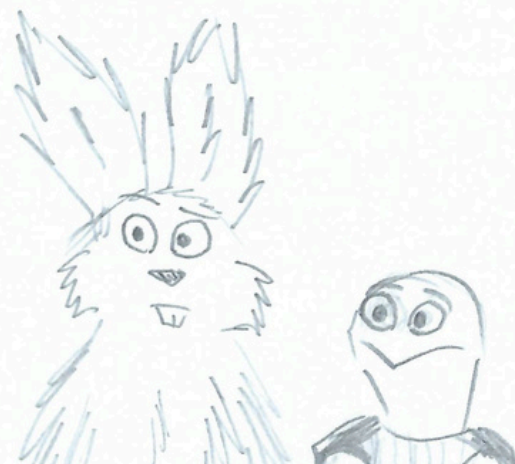

why Did I point out
the catapult?

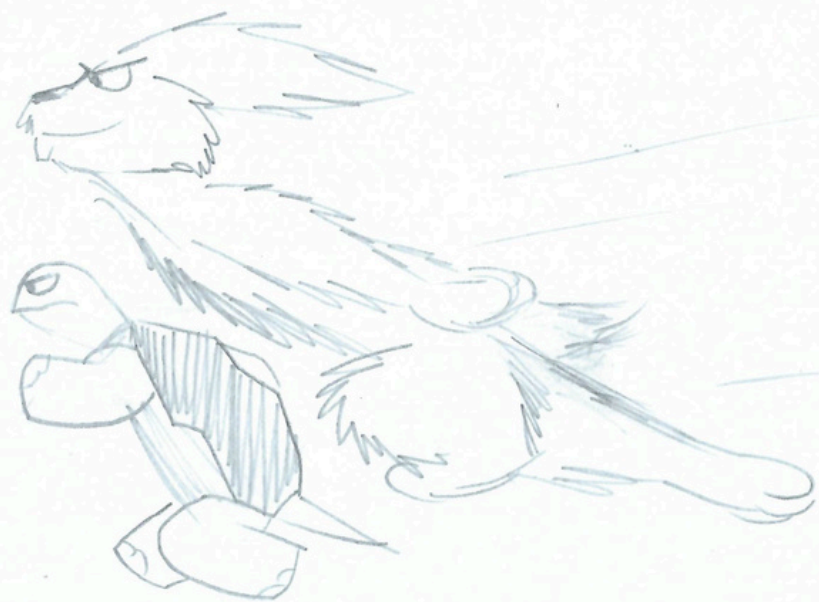

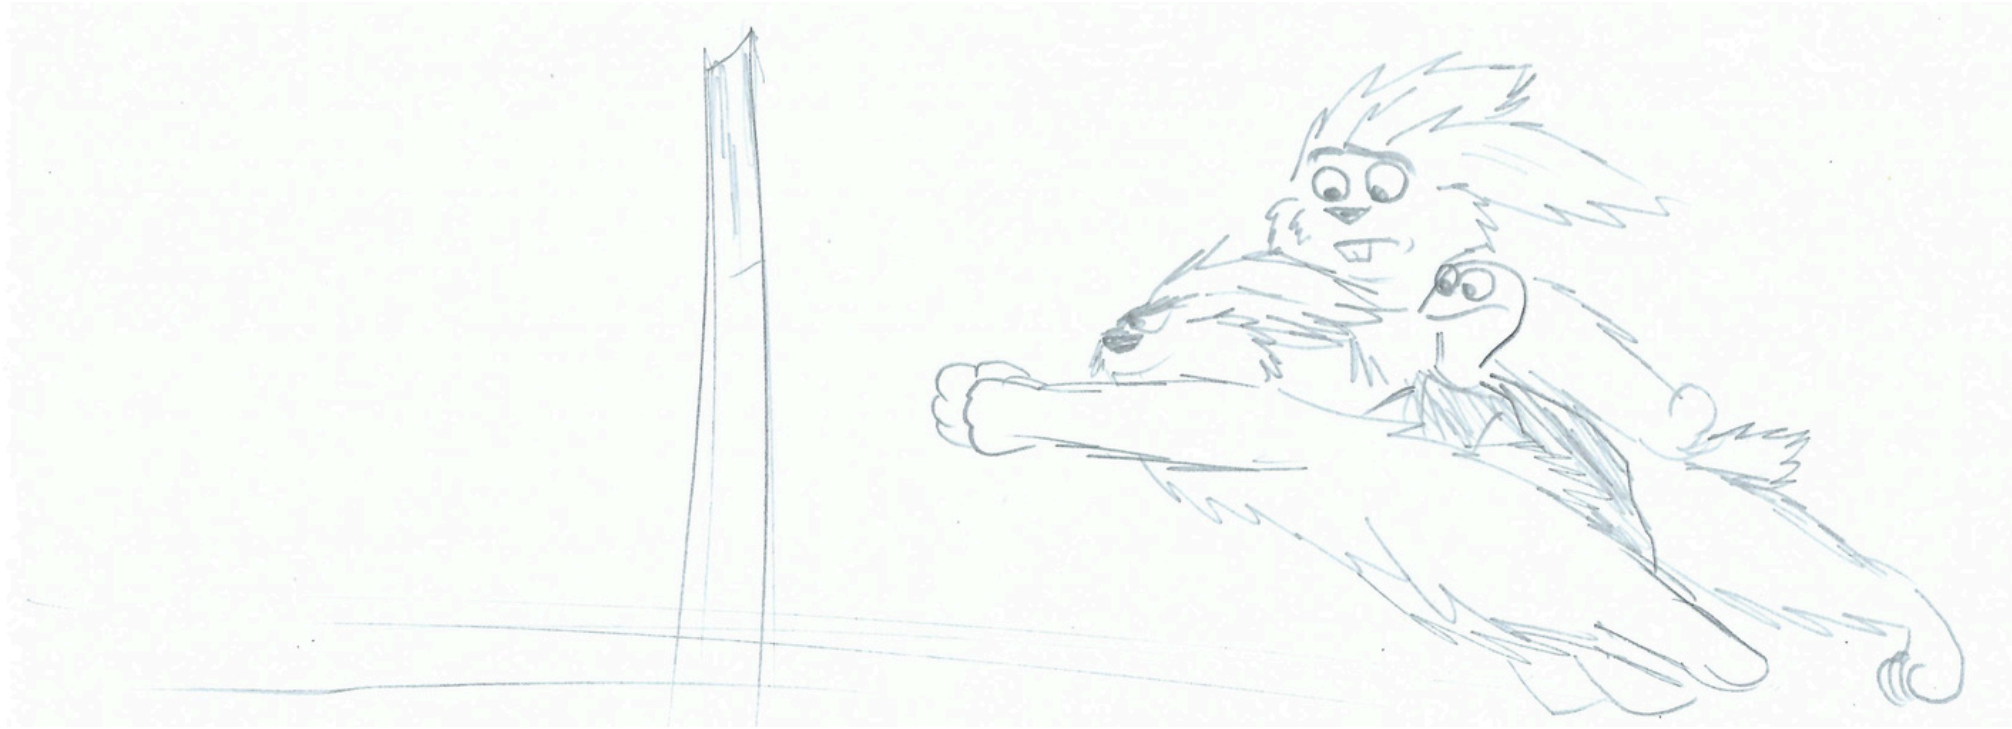

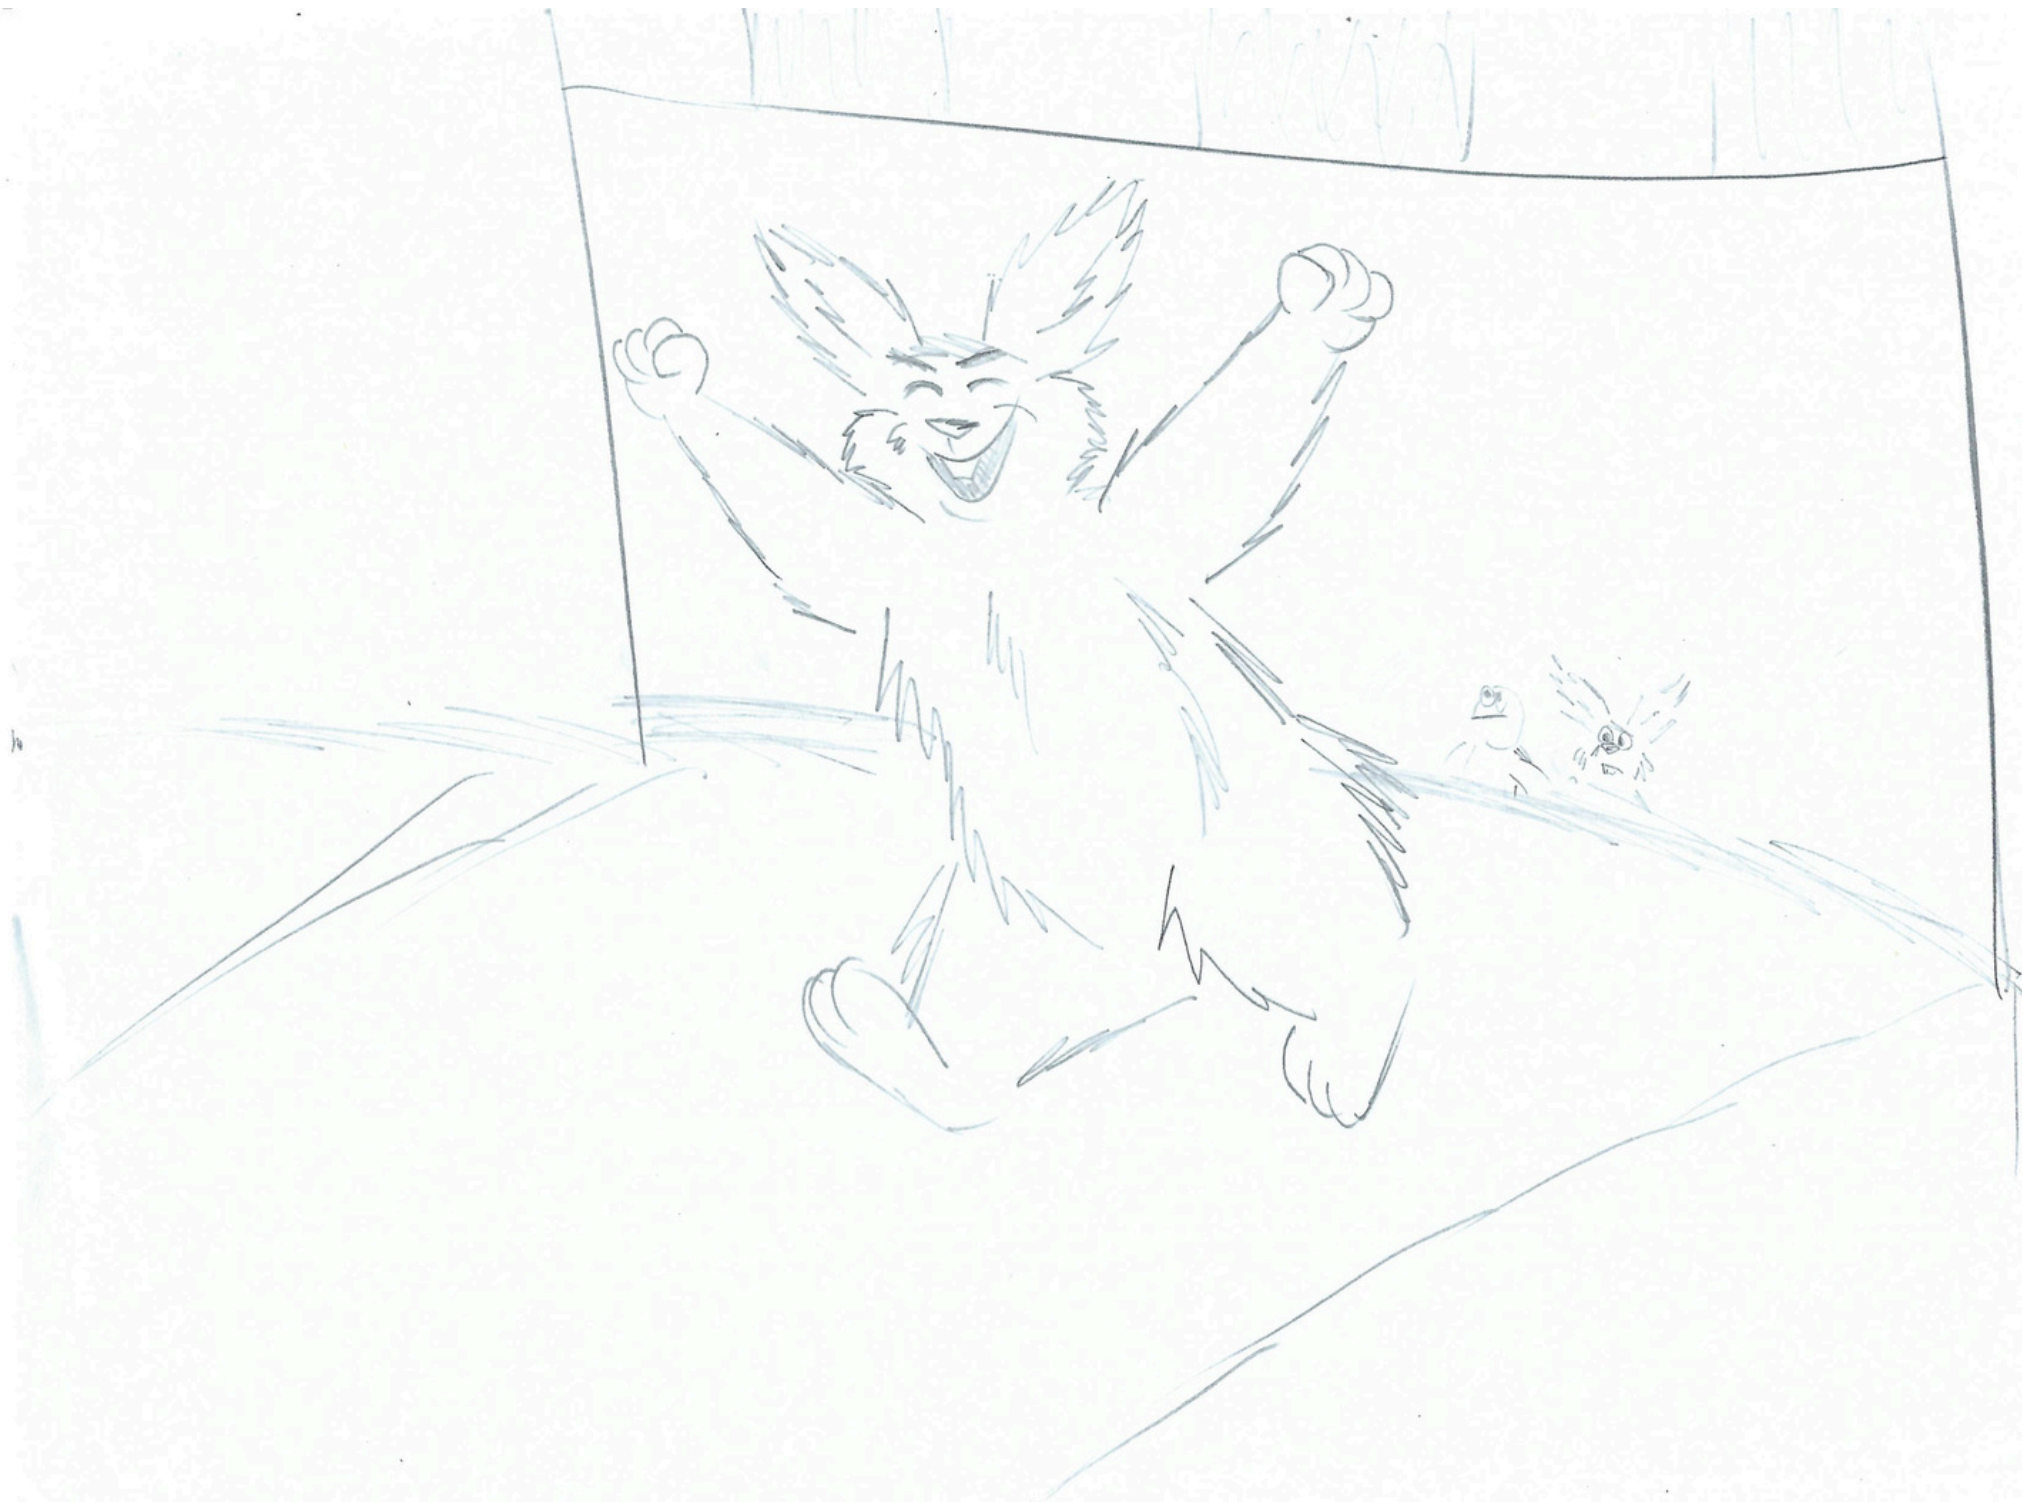

Handwritten mark or signature.

H Did you know he was racing? I thought this was just about us.

T I think it was. But there are no rules. So...

[you got that right.
Good game to you too!
You're a lot faster —
than I thought you'd be.

[Good game Hare
You're pretty quick!]

Well, I Guess
we'll never know
whether the tortoise
or the Hare is faster.
Perhaps the question has
No answer.

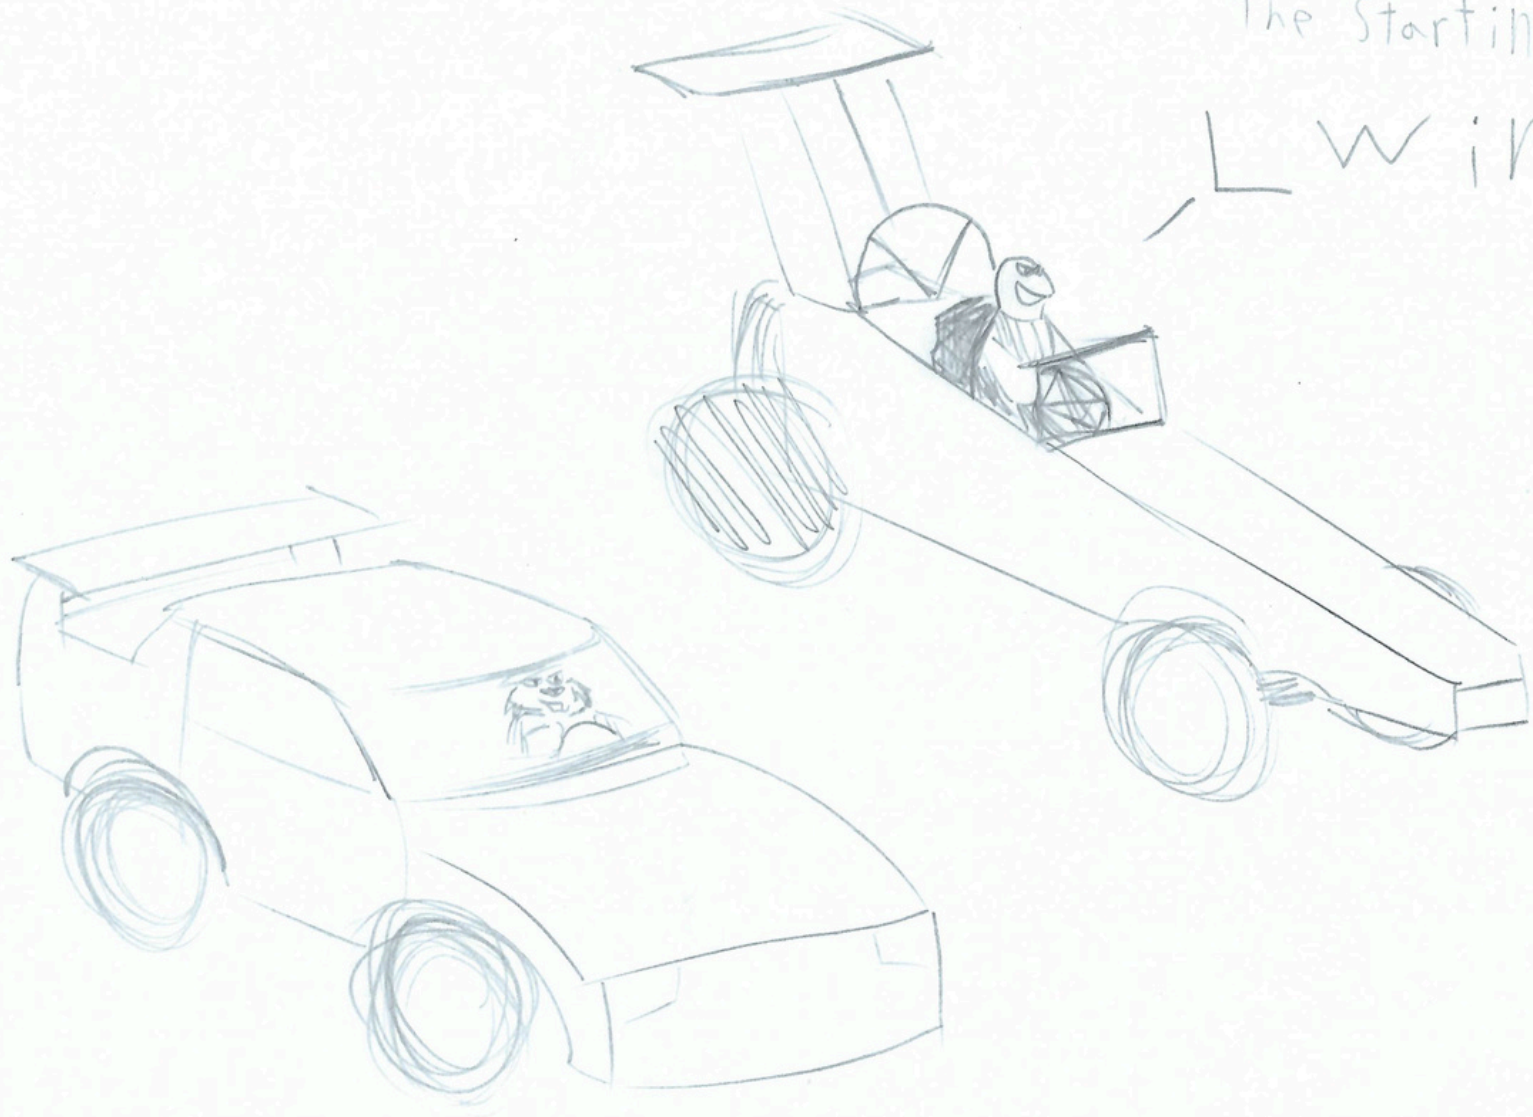

「You hear that, Hare?
Sounds like another
Challenge!」

First one to
the starting line

L WINS!

4

And they're off.

It was not a challenge.

but, it seems a bit late for that.
