Election Management Software

1. Incoming ballots are received by mail
2. Ballot envelopes are scanned and stamped with the date and time it was scanned, along with a batch number on each ballot
3. The Vote-By-Mail software, captures the signature image from the envelope and compares it to the Voter Registration Database, and calculates a comparison score.
4. Based on the score, the signature is either automatically validated or flagged for further validation
5. Validated signature against a reference signature so ballot can then be exported to the Election Management Software
