SERVICING NOTES

The FET's used in the TA-2000F are selected according to their Idss rank, so use replacement FET's with the exact same Idss rank.

Idss rank is indicated by the identification number, as shown in Fig. A.

On all plug-in type PC boards except the MUTING/POWER SUPPLY board, left- and right-channel conductor-side patterns are designed symmetrically. This makes a trouble check possible through interchange of channels by reinserting the boards upside down.

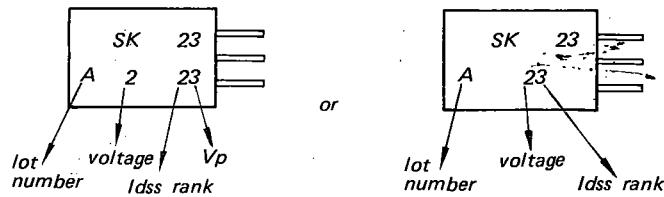

Fig. A Example of Idss rank

SECTION 1

TECHNICAL DESCRIPTION

1-1. TECHNICAL SPECIFICATIONS

Technical specifications for the TA-2000F are given in Table 1-1.

TABLE 1-1. SPECIFICATIONS

Frequency response:	PHONO-1, 2 : RIAA curve ± 0.5 dB MIC : 30 Hz to 30 kHz ± 2 dB TUNER, AUX 1, 2, 3 TAPE 1, 2 REC/PB (input)	(LOW LEVEL) : greater than 50 dB (weighting network B) PHONO 2 : greater than 73 dB (weighting network A) MIC : greater than 50 dB (weighting network B) TUNER, AUX 1, 2, 3 TAPE 1, 2 REC/PB (input)
Input sensitivity and impedance:	PHONO-1 : 1.2 mV (HIGH LEVEL) 33k 47k 82k (LOW LEVEL) 0.06 mV 10 ohm 30 ohm PHONO-2 : 1.2 mV 47k MIC : 0.5 mV 100k TUNER AUX 1, 2, 3 TAPE 1, 2 REC/PB (input)	Tone controls: BASS : ± 10 dB at 50 Hz (TURNOVER FREQ. 250 Hz) ± 10 dB at 100 Hz (TURNOVER FREQ. 500 Hz) ± 10 dB at 10 kHz (TURNOVER FREQ. 2.5 kHz) ± 10 dB at 20 kHz (TURNOVER FREQ. 5 kHz) TREBLE : ± 10 dB at 50 Hz (TURNOVER FREQ. 250 Hz) ± 10 dB at 100 Hz (TURNOVER FREQ. 500 Hz) ± 10 dB at 10 kHz (TURNOVER FREQ. 2.5 kHz) ± 10 dB at 20 kHz (TURNOVER FREQ. 5 kHz)
Maximum input capability:	PHONO-1 (HIGH LEVEL) : 300 mV (LOW LEVEL) : 15 mV PHONO-2 : 300 mV MIC : 1,200 mV	Filters: LOW: 12 dB/oct, below 50 Hz HIGH: 12 dB/oct, above 9 kHz Harmonic distortion: IM distortion: Less than 0.05% at rated output (60 Hz:7 kHz = 4:1)
Signal output level and impedance:	OUTPUT : 1 V 3k 1, 2 : 0.3 V 6k REC OUT : 100 mV 10k 1, 2 : (max 30 V) CENTER : 5 V 2.6k HEADPHONE : 0.5 V OUT (8 ohm load) REC/PB : 30 mV 82k (output)	Power consumption: 23 watts Power requirements: 117V ac, 50/60 Hz Dimensions: 400 mm (width) x 149 mm (height) x 315 mm (depth) 15 $\frac{3}{4}$ " (width) x 5 $\frac{13}{16}$ " (height) x 12 $\frac{7}{8}$ " (depth) Net weight: 9 kg (19 lb 12 oz) Shipping weight: 11.2 kg (24 lb 12 oz)
Signal-to-noise ratio:	PHONO 1 (HIGH LEVEL) : greater than 73 dB (weighting network A)	

1-2. DETAILED CIRCUIT ANALYSIS

The following text describes the function or operation of all stages and controls. The text sequence follows signal paths. Stages are listed by transistor reference designation at the left margin; major components are also listed in a similar manner. Refer to the block diagram on page 9 and the schematic diagram on pages 35 to 36.

Stage/Control Function

PHONO-1 Equalizer/Head Amp

Head Amplifier Q101 Amplifies extremely small input signals (as from a moving-coil type cartridge) to the level required at following equalizer amplifier. A common-gate configuration is suited to this job because it has low input impedance and high voltage gain. Input signal applied to the PHONO-1 terminal is routed to this amplifier only when IMPEDANCE SELECTOR switch S10 is set to the 30 ohm or 10 ohm position.

IMPEDANCE SELECTOR switch S10 S10 changes the PHONO-1 input impedance to meet the cartridge manufacturer's recommended load impedance because of its effect upon frequency response.

**Equalizer Amplifier Q102, Q103
Q104, Q105
Q106** This newly developed direct-coupled four stage amplifier amplifies the phono cartridge signals to the level required at the input of the following tone-amplifier. Q102 forms a conventional FET amplifier while Q103 and Q104 act as buffer amplifier which has a high input impedance.

This FET-PNP combination amplifier forms a modified source-follower circuit in which Q104 acts not only as constant-current source, but also as a drive amplifier for the negative-going half cycle. This has the advantage of low harmonic distortion and wide dynamic range. In addition, the FET generates less noise than a conventional silicon transistor.

Stage/Control

Function

The FET's used in TA-2000F are selected according to their Idss rank, and care should be taken to use replacement FET's with the exact same Idss. Idss is indicated by the identification number, as illustrated in Fig. 1-1. Note that Q105 and Q104 are newly developed high-voltage transistors which make the wide linearity (dynamic range) possible. For this purpose, a 150-volt power supply is employed.

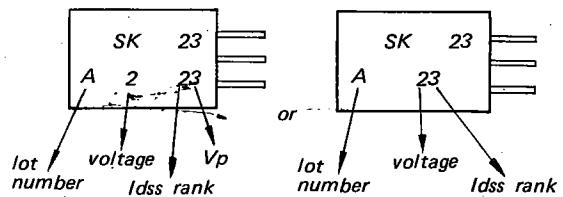

Fig. 1-1. Example of Idss rank

Bias circuit

Dc bias voltage for Q102 is determined by the current flow in source resistor R112, and the dc negative feedback voltage applied to the gate of Q102 from the emitter circuit of Q105 through R110, R107 and R109. This dc negative feedback technique provides stable operation. Dc bias voltage of Q103 is determined by the drain voltage of Q102 and the current flow in the Q103 (which is restricted by its Idss). Current flow in Q103 also determines the bias voltage applied to the Q104 and Q105 as they are directly coupled.

Equalization circuit

RIAA equalization is achieved by the negative-feedback loop containing R117, R118, R119, C110 and C109. Be sure to use replacement components with the exact same values. The equalizer amplifier's output is fed to the FUNCTION-2 switch through R120 ($1\text{ k}\Omega$) to prevent interaction between the left and right channels when the MODE switch is set to L + R.

*Stage/Control**Function***MIC Amplifier/PHONO-2 Equalizer Amplifier Section**

MIC Amplifier
Q301, Q302
Q303, Q304

The MIC amplifier consists of two pairs of FET-NPN amplifiers. They amplify the signals provided by the microphones to the level required at the input of the tone-amplifier.

An FET has high input impedance and generates less noise than conventional silicon transistors. Therefore, FET's are employed in the low-level amplifiers. Note the high-voltage transistor Q302 (Q304) employed in the second-stage amplifier. This eliminates distortion due to strong input signal causing saturation in the low-level amplifier.

Bias circuit

Dc bias voltage for Q301 is determined by the current flow in the source resistor R306, and the dc negative feedback voltage applied to the gate of Q301 from the emitter circuit of Q302 through R304 and R302.

MIC amplifier
Q303, Q304

Q303 and Q304's operation is the same as described in Q302 and Q303. Note that the last stage (Q304) is a conventional transistor since the high-level input signal is sufficiently attenuated by means of MIC LEVEL control VR6 so as not to saturate Q303 and Q304. The MIC LEVEL control and mixing switch S15 are mechanically connected to perform the mixing operation.

MIC LEVEL
control VR6
mixing switch
S15

Same as described in PHONO-1 equalizer amplifier section except for reference numbers. Note that the output of this amplifier can be controlled by means of VR1, LEVEL ADJUST.

PHONO-2
Equalizer
Amplifier

Q305, Q306
Q307, Q308
Q309

Input signals applied to the TAPE-1, TUNER, AUX-1, AUX-2 input terminals are controlled respectively by means of VR5, VR2, VR3 and VR4. All input signals are routed to FUNCTION-1 or FUNCTION-2

*Stage/Control**Function*

switches. Note that the TAPE-TO-TAPE positions in the FUNCTION-1 switch are provided for tape duplicating as noted in Table 1-2.

TABLE 1-2.

FUNCTION-1 Position	Tape Recorder-1	Tape Recorder-2
TAPE-TO- TAPE 1-2	Playback	Recording
TAPE-TO- TAPE 2-1	Recording	Playback

REC OUT

Buffer Amp

Q01, Q51

All input signals are equalized or controlled by means of equalizer or LEVEL ADJUST resistors, and then fed to the FUNCTION switches.

The signals for REC OUT are extracted from the signal path between the FUNCTION switches and MODE switch, and then fed to each set of REC OUT terminals through buffer amplifier (emitter follower) Q01. Q01 eliminates interaction between the tape recorder and the TA-2000F's signal path. Note that Q01's output is routed through muting relay REL-1.

MONITOR
switch S3

In the TAPE-1 position, input signals connected to either the TAPE-1 terminal or REC/PB connector is selected. In the TAPE-2 position, the input program connected to the TAPE-2 terminal is selected. In the SOURCE position, all other program sources are selected.

MODE switch

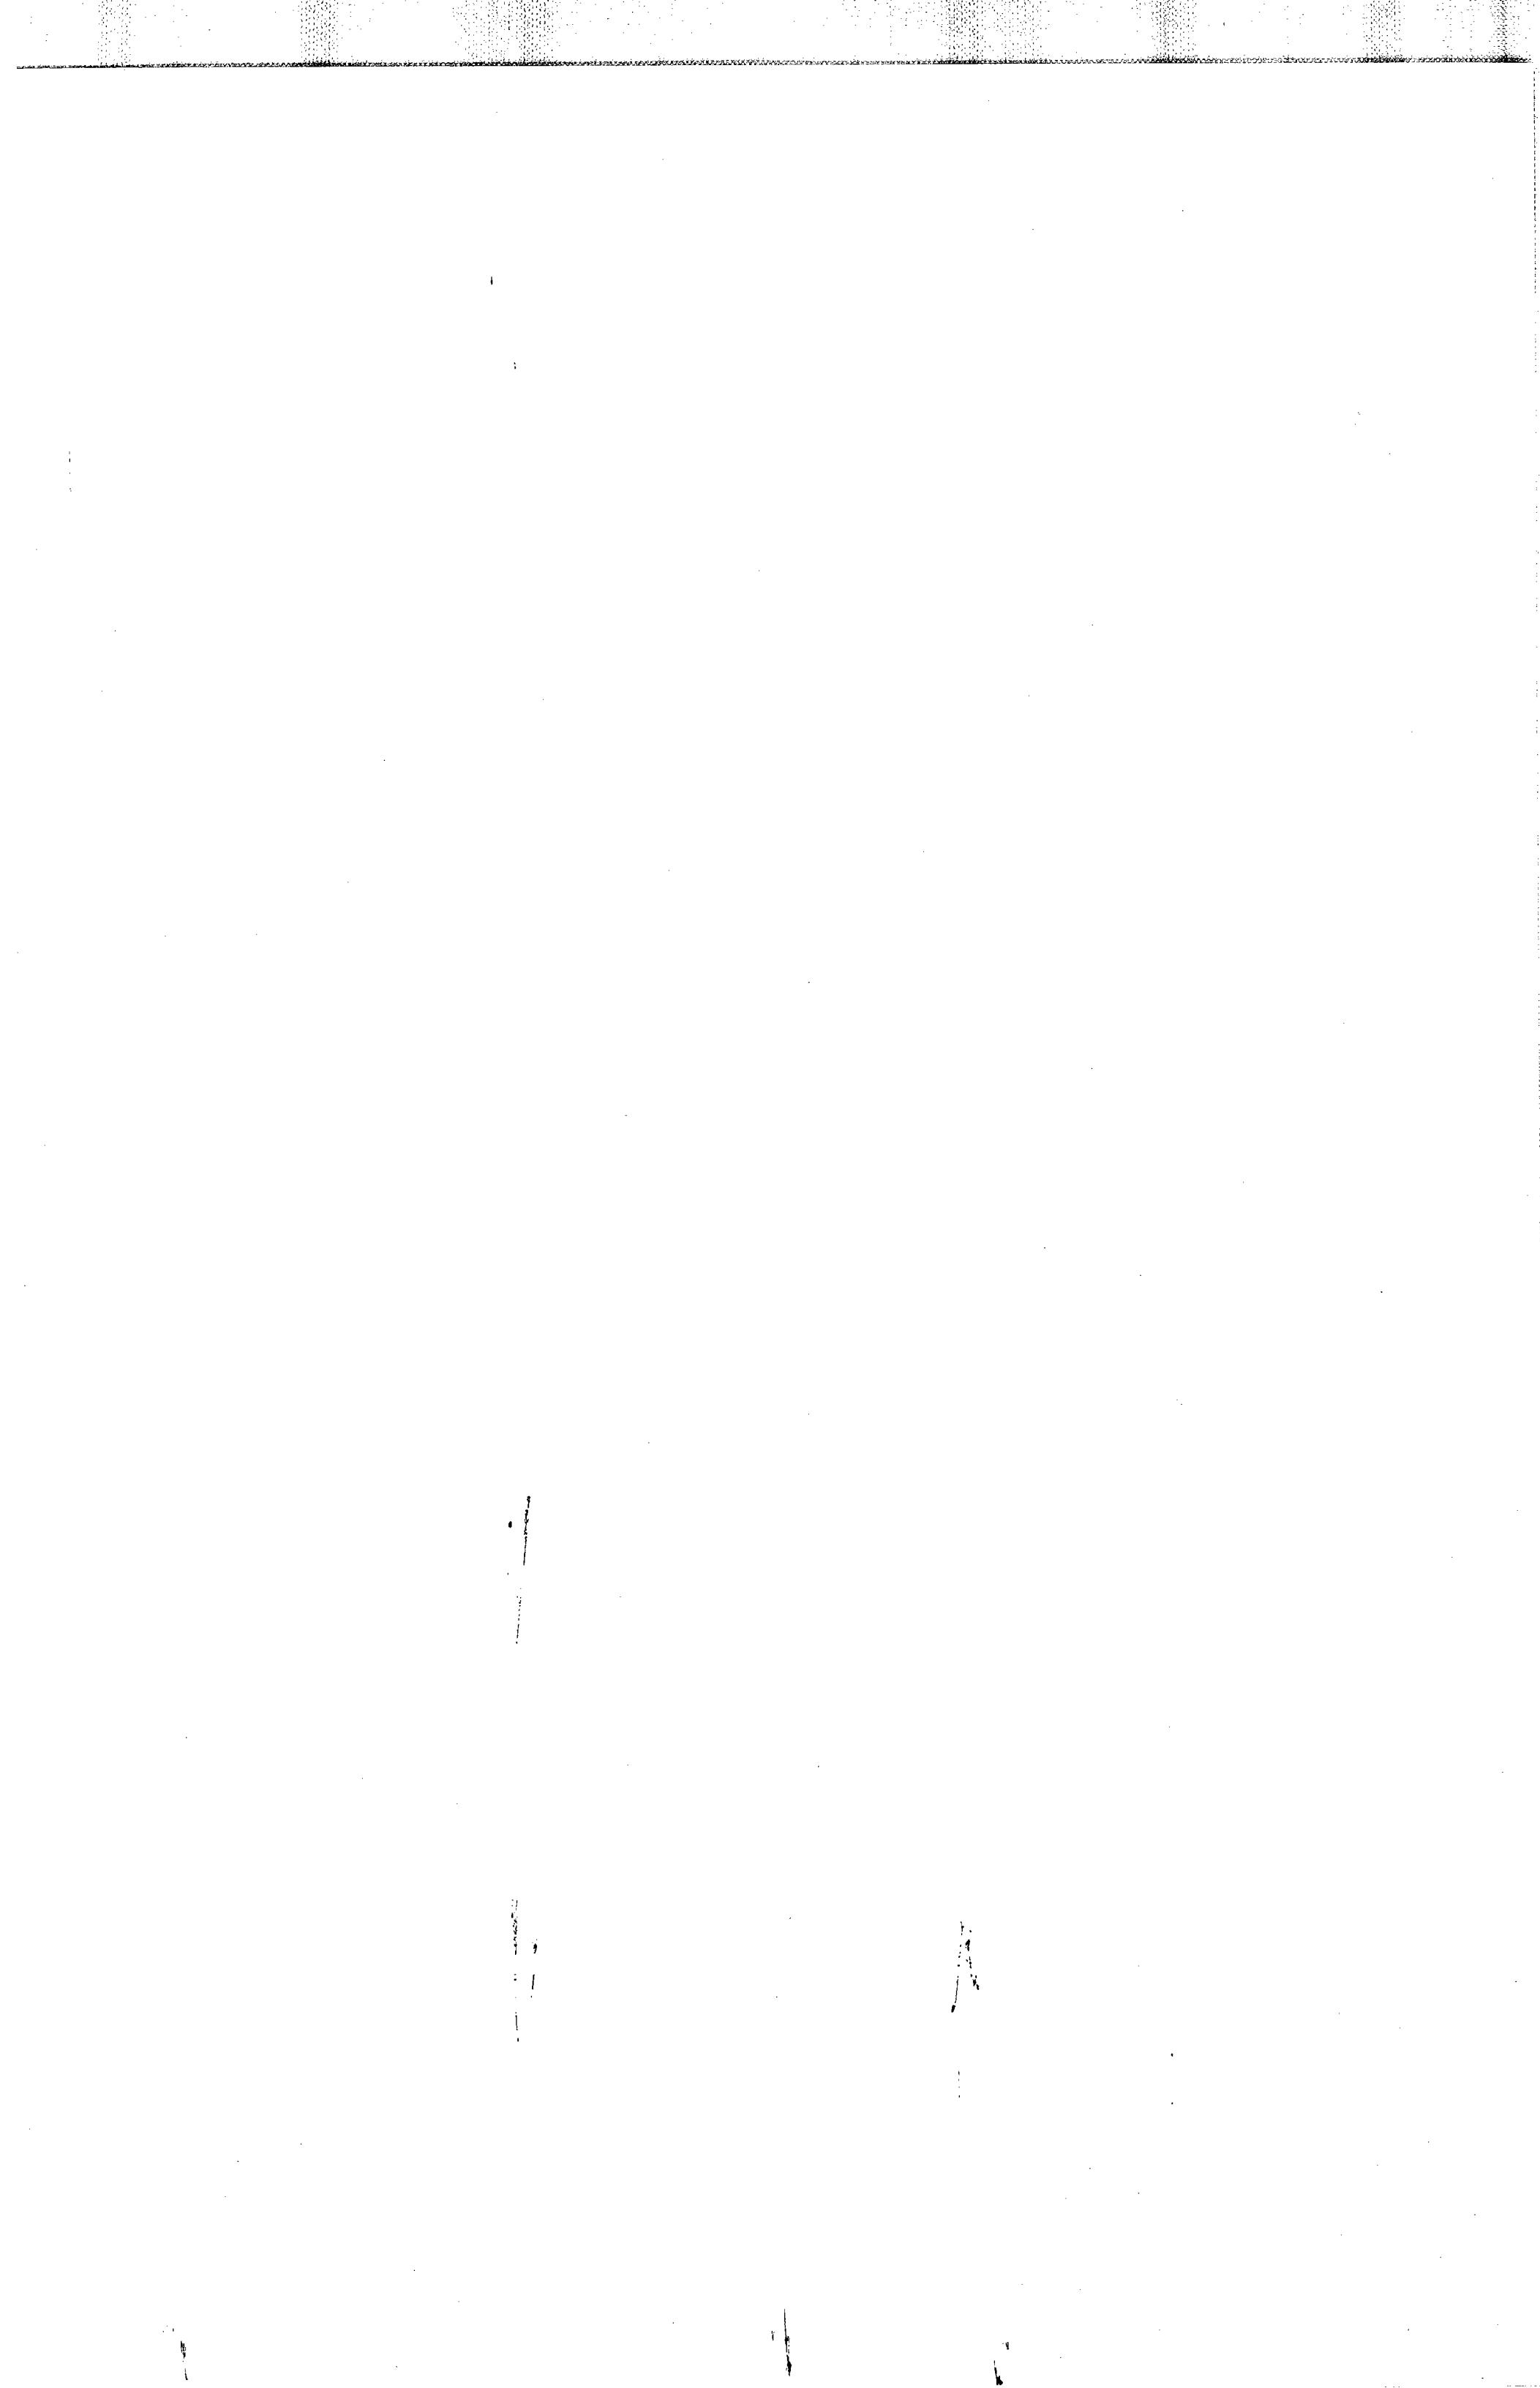

Selects the desired mode of operation. This switch may also be used for test purposes. The relation between the positions of the MODE switch and outputs of the set are summarized in Table 1-3.

BALANCE
control VR7

Input signal is routed to the BALANCE control through MODE switch S4. This is done to optimize stereo reproduction. To eliminate insertion loss at

SCHEMATIC DIAGRAM

*Stage/Control**Function*

the mechanical center of movement, a special potentiometer having a conductive coating over half its element length is used.

VOLUME
control
VR8

The balanced input signals from BALANCE control VR7 is fed to VOLUME control VR8, which regulates the signal applied to the following tone-control circuit or output circuit.

Tone Amplifier Section

Tone Amplifier
Q501, Q502
Q503

This three-stage amplifier has basically flat response, and provides 20 dB voltage gain to compensate for tone-control insertion loss. It also isolates the volume-control and tone-control circuits to eliminate mutual interference. The input signals are amplified by Q501 and Q502, and then applied to source follower Q503.

Bias circuit

Bias voltage for Q501, Q502 and Q503 is determined by the current flow in their respective source resistors. Negative feedback is applied from the source circuit of Q503 to the source circuit of Q501 through C505, R509, and C506 to obtain a flat and wide response. Tone-amplifier-1's output is fed to an RC-type tone-control circuit through TONE CANCEL switch S5 when S5 is set to "ON".

TONE CANCEL
SW S5

*Stage/Control***Tone Control Section**

All inputs are applied this circuit when TONE CANCEL switch S5 is set at ON. Fig. 1-2 shows the simplified circuit of tone control incorporated with the treble and bass turnover switches.

TREBLE control
S6

Increases or decreases the amount of high-frequency components by switching the resistors connected to S6 in steps.

TREBLE TURN-
OVER FREQU-
ENCY switch

S8 selects the specified turn over frequencies (2.5 kHz or 5 kHz). Refer to Fig. 1-3.

BASS control
S7

Increases or decreases the amount of low frequency components by switching the resistors connected to S7 in steps.

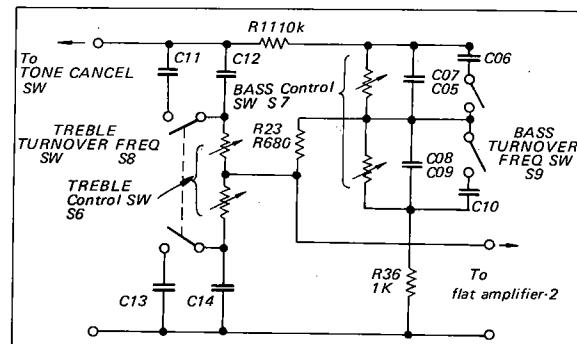

Fig. 1-2. Simplified tone control network

TABLE 1-3. OUTPUTS

MODE SWITCH POSITION	CENTER CHANNEL OUT	HEADPHONE OUT;		RECOUT-1, 2, REC/PB OUT;		OUTPUT	
		L-CH	R-CH	L-CH	R-CH	L-CH	R-CH
CHECK L	L + R	L + R		L + R	L + R	L + R	
CHECK R	L + R		L + R	L + R	L + R		L + R
REVERSE	L + R	R	L	L	R	R	L
STEREO	L + R	L	R	L	R	L	R
L + R	L + R	L + R	L + R	L + R	L + R	L + R	L + R
LEFT	L	L	L	L	R	L	L
RIGHT	R	R	R	L	R	R	R

Stage/Control	Function	Stage/Control	Function
BASS TURNOVER FREQUENCY switch S9	BASS TURNOVER S9 selects the specified turnover frequencies (500 Hz or 250 Hz). Refer to the Fig. 1-3 (tone control response).		These unwanted low frequencies include rumble created by the turntable, record changer, or the record itself. See Fig. 1-4.
	When TONE CANCEL switch S5 is set to CANCEL, the line signal is bypassed around the tone-control circuit and is fed directly to the output circuit through FILTER switch S11.	OFF position	All filter circuits are removed from signal paths and have no effect upon frequency response.
Tone-amplifier-2 Q504, Q505, Q506	Same as tone-amplifier-1 except for reference numbers.	HIGH (9 kHz) position	High-cut filter (L02, C16) cuts out unwanted high-frequency components from the input signals (12 dB/oct above 9 kHz). These unwanted high frequencies include hiss noise created by tape deck or tape itself. See Fig. 1-4.
FILTER switch S11	Selects the desired filtering operation. LC filter circuits are employed to eliminate insertion loss.	BOTH position	Both low- and high-cut filters are effective. See Fig. 1-4.
LOW(50 Hz) position	Low-cut filter (C15, L01) cuts out unwanted low frequency components from the input signals (12 dB/oct below 50 Hz).		The signal from the FILTER switch is routed to the OUTPUT jacks through OUTPUT LEVEL switch S13.

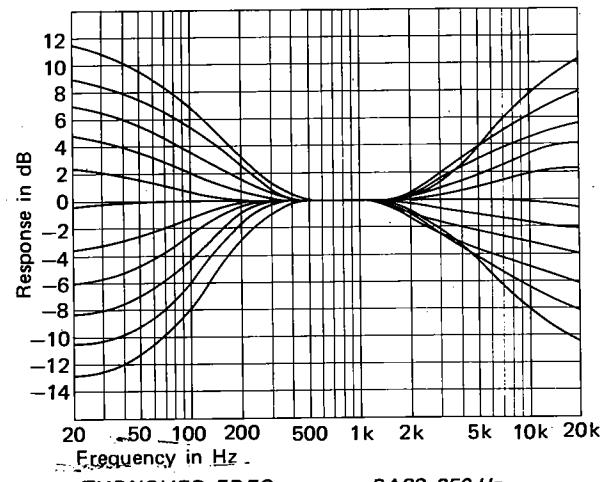

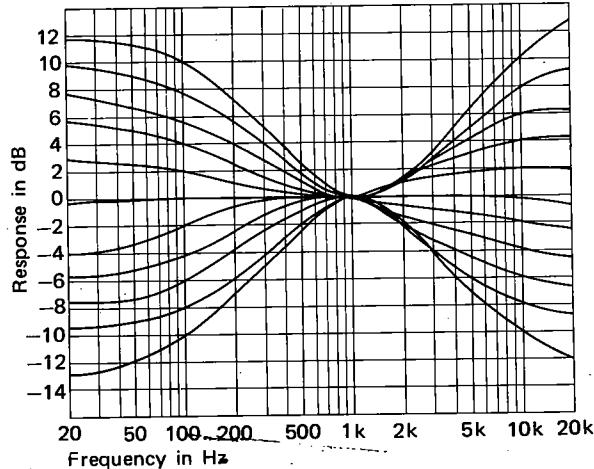

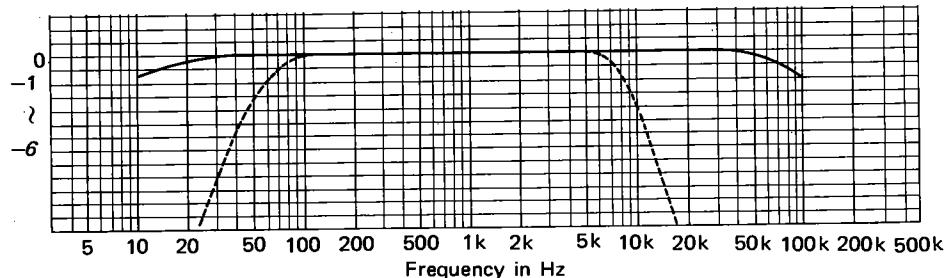

Fig. 1-3. Tone control frequency response

Input signal applied to TUNER inputs Output: 1 volt (OUTPUT LEVEL switch set to 1 V)

Fig. 1-4. Filter response

<i>Stage/Control</i>	<i>Function</i>	<i>Stage/Control</i>	<i>Function</i>
OUTPUT LEVEL switch S13	The output voltage can be changed by S11, which has two calibrated positions (0.3V and 1.0V), and should be set according to the requirements of the equipment to be connected. Note that the signal supplied to the OUTPUT-2 terminal is routed through the leaf switch in the HEADPHONE jack. As the result, no signal will appear at the OUTPUT-2 terminal during headphone monitoring.	Driver Q705	Though this stage is a conventional flat amplifier, it determines the output voltage swings because the following stage is basically in the emitter-follower configuration. The ac load resistor for this stage is R718 in the collector circuit.
METER LEVEL switch S12	Level meter sensitivity can be varied by switching S12. In 0dB position, the reading on the meter shows the actual output value. In the -10 (-20) dB position, the sensitivity of the meter increases 10 (20) dB up from the 0 dB position. Output signal is routed to meter amplifier through METER LEVEL switch S12 to permit VU meter monitoring. In the MIC position, only the MIC amplifier's output is fed directly to the meter amplifier.	Power amplifiers (complementary stage) Q706, Q707	These transistors operate as emitter-followers to provide the current swings required and also perform the necessary phase inversion to drive the load in push-pull.
Meter amplifier Q701, Q702 Q703	This three-stage direct-coupled amplifier increases the extracted output signals to the level required to drive the level meter. The meter amplifier output is rectified and supplied to the VU meter through bridge rectifier diodes D701 ~ D704.	CENTER CHANNEL OUTPUT jack	Phase inversion is performed by using PNP and NPN type transistors. Q706 supplies power during the positive-going half cycle, while Q707 supplies power during the negative-going half cycle. The output is fed to the HEADPHONE jack through coupling capacitor C711.
Level meter adj. R701	Semifixed resistor R701 in the meter amplifier calibrates the VU meter.	Muting circuit Q907, Q908 Q909, Q910	It also supplied to the CENTER CHANNEL output jack through R729 for use in center-woofer systems. Note that the left- and right-channel signals are mixed at this jack.
Headphone amplifier Q704, Q705 Q706, Q707 HEADPHONE LEVEL VR9	Supplies enough power to drive the headphone used for monitoring. The output signal is controlled by means of HEADPHONE LEVEL control VR9. Q704 is a preamplifier which increases the input signal to the level required at the following driver stage.		This muting circuit prevents the loud "pop" (due to initial current flow) or click noises from occurring just after turning the power switch to ON. These transients might damage a delicate high-fidelity speaker system. The base of Q909 (Q910) is connected to the collector circuit of Q908 through R914 (R913), while the base of Q908 is connected to an RC network (R910, C902) having a long time constant. Negative bias voltage is produced by D907 and C903, and then fed to the base circuit of Q909 (Q910) through R912. This effectively mutes the input signals up to 20V peak-to-peak. When you first turn ON the power switch, Q908 remains off due to the long time constant of the as-

*Stage/Control**Function*

sociated bias circuit, while Q909 (Q910) is forward biased by R911. As a result, Q909 (Q910) is ON, shorting the output circuit to ground, and effectively muting the output signals. As Q908 is gradually turned ON due to the slowly-increasing base current flow, Q908 conducts and cuts off Q909 (Q910), removing the muting. Q907 is employed to discharge C902 quickly when power switch is turned off, preparing it for the next muting operation.

REC OUT
Muting circuit
Q911, Q912

This circuit is employed to mute the REC OUT signals by means of relay REL-1, preventing the loud "pop" or click noises just after turning the power switch to ON. The base of Q911 is connected to the collector circuit of Q912, while the base of Q912 is connected to an RC network (R903, C901) having a long time constant. When you first turn ON the power switch, Q912 remains off due to the long time constant of the associated bias circuit. This keeps open the muting relay, disconnecting the buffer amplifier's (Q01) output from the REC OUT signal path. As Q912 is gradually turned ON due to the slowly-increasing base current flow, Q912 conducts and turns on Q911, energizing the muting relay to deliver the buffer amplifier's output to the REC OUT terminal.

Power Supply Section

Two independent regulated pow-

*Stage/Control**Function*

er supplies are employed to obtain stable operation. One is a low-voltage supply delivering 37 volts dc, and the other is a high voltage supply delivering 150 volts dc. As both power supplies have the same configuration, only the low-voltage regulator circuit is described here. The high-voltage supply is identical except for reference numbers.

Voltage regulator
Q901, Q902, Q903
(Q904, Q905,
Q906)

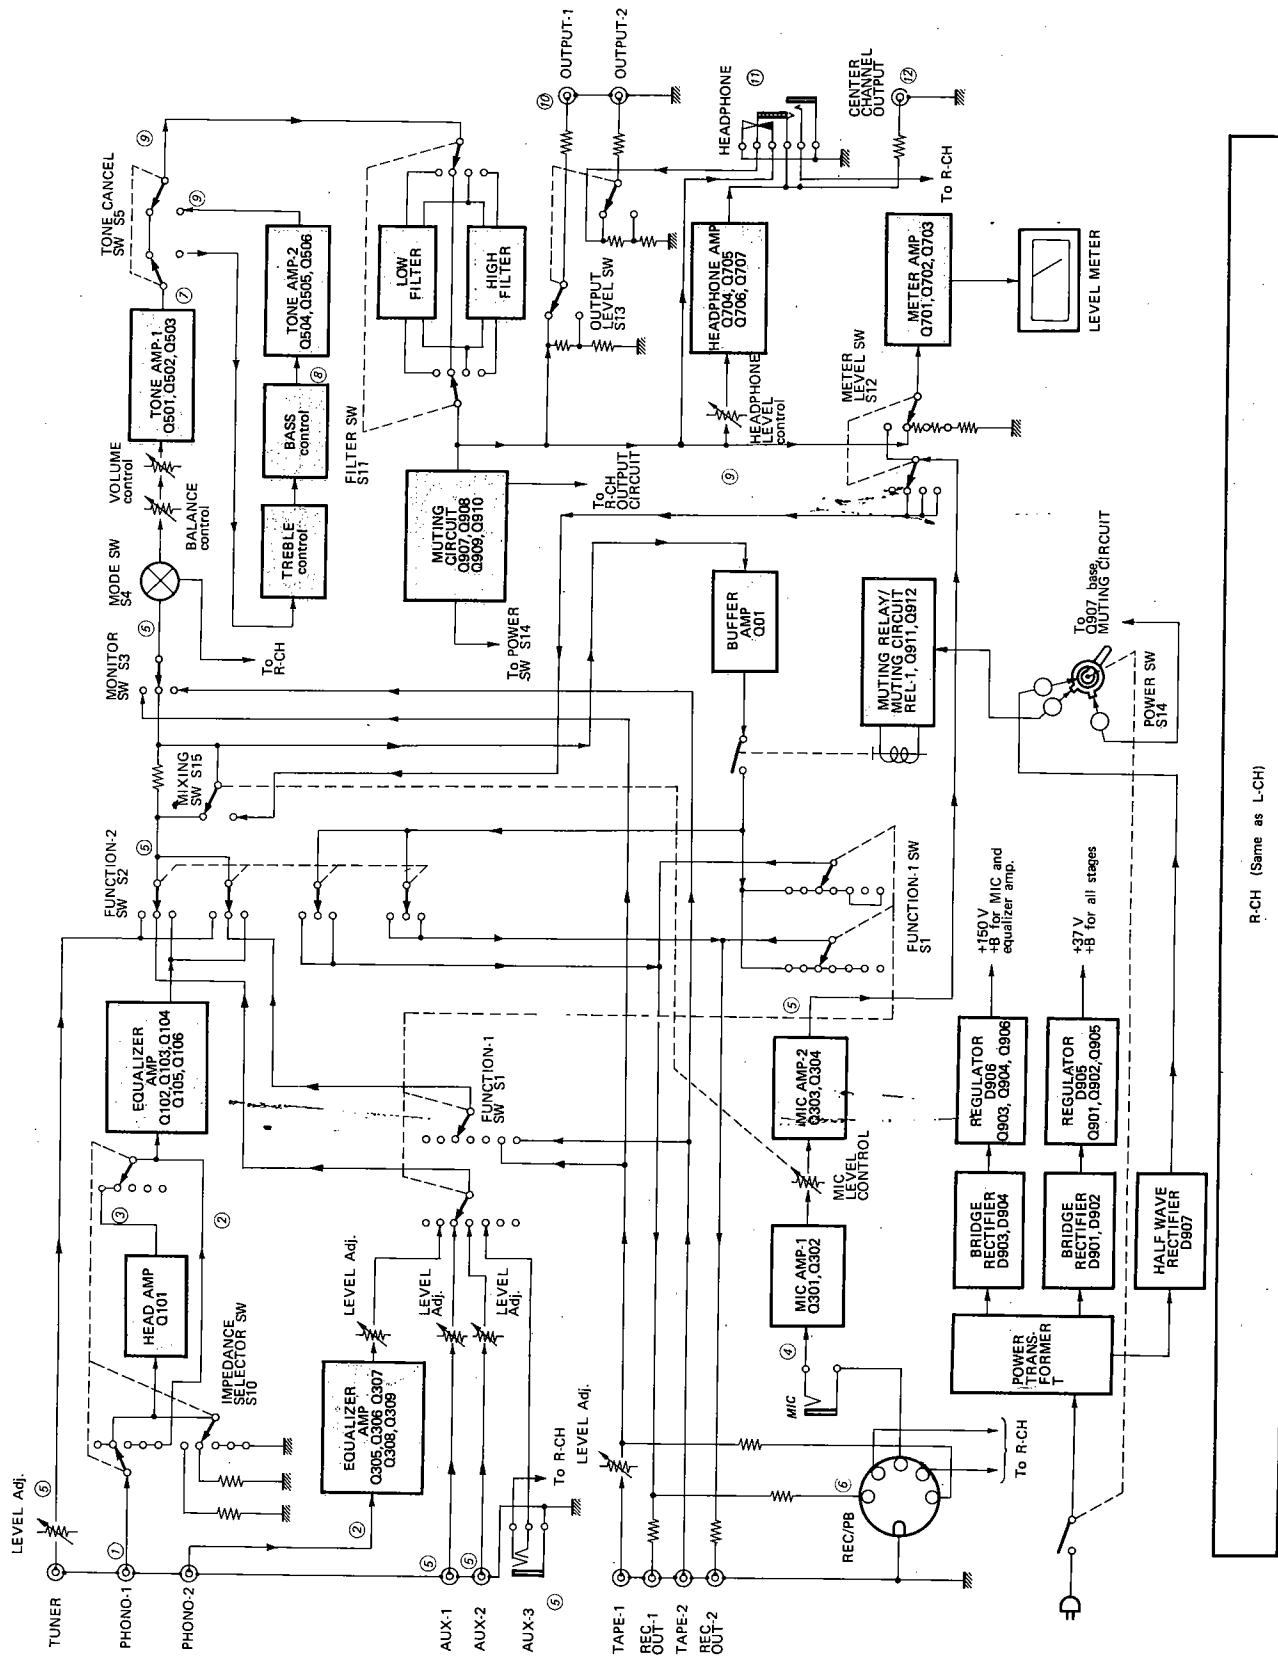

Dc output from bridge rectifier D901 and D902 (D903 and D904) is filtered by C18 (C17) and applied to series regulator Q901 and Q902 (Q904 and Q905).

Q903 (Q906) compares a sample of the output voltage picked off across power supply adjust control R926 (R920), with reference voltage supplied by zener diode D905 (D906).

A change in the output voltage is detected at the base of Q903 (Q906) and therefore alters its collector voltage. Since the collector of Q903 is directly coupled to the base of Q902 (Q905), the change in output voltage alters the conduction of Q901 and Q902 (Q904 and Q905) by the amount necessary to maintain the output voltage constant.

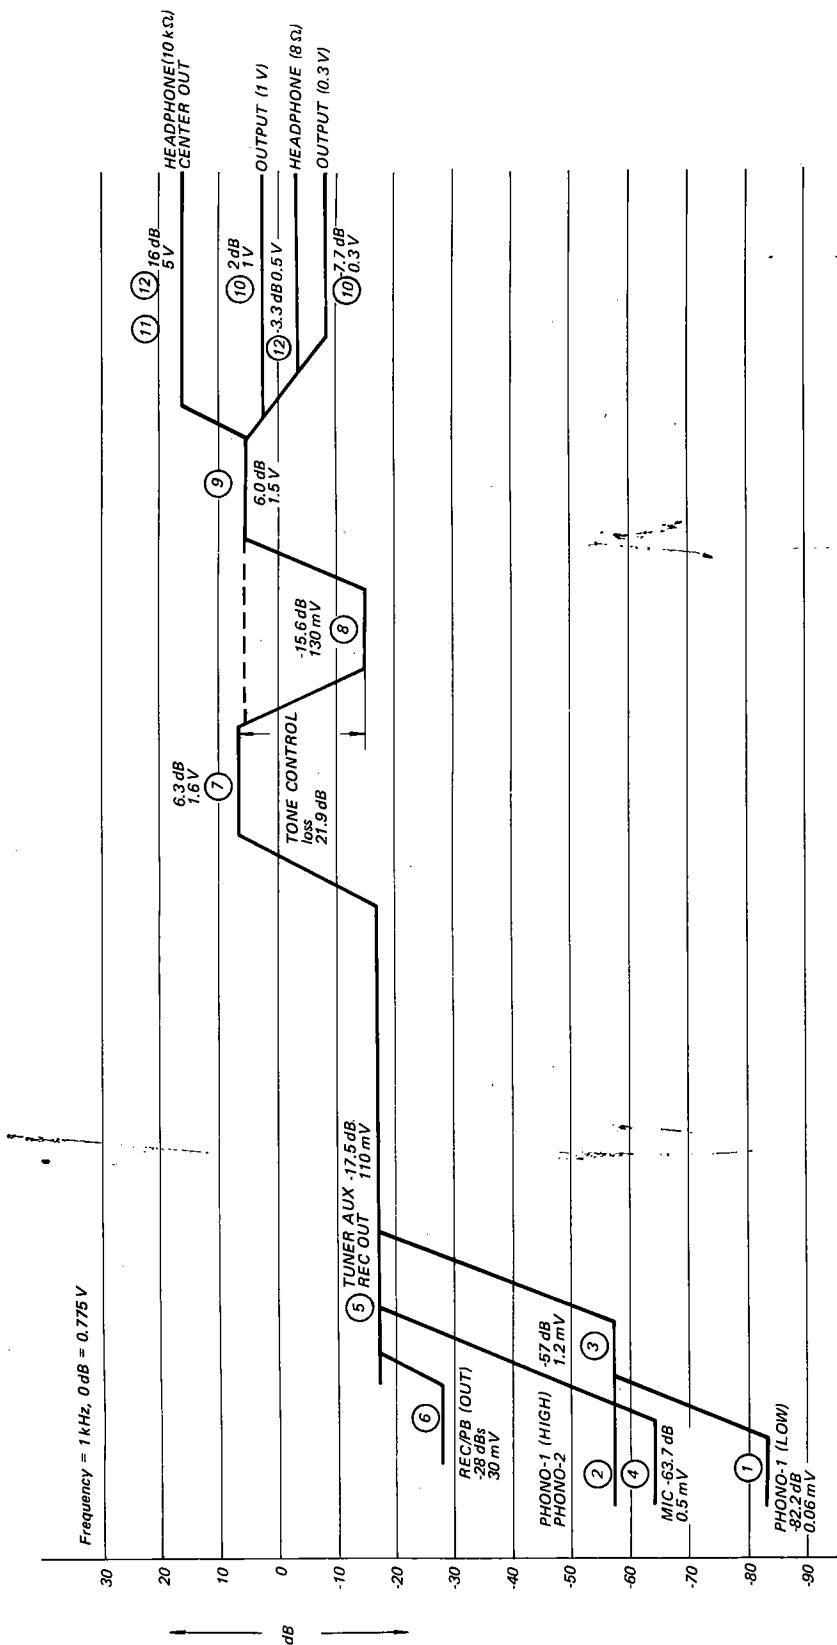

An increase in output voltage causes an increase in the impedance (decrease in conduction) of Q901 and Q902 (Q904 and Q905), and vice-versa. The dc output voltage supplied to the preamplifier section is therefore extremely stable.

SECTION 2

DISASSEMBLY AND REPLACEMENT PROCEDURES

WARNING

Unplug the ac power cord before starting any disassembly or replacement procedures.

2-1. TOOLS REQUIRED

The following tools are required to perform disassembly and replacement procedures on the TA-2000F.

1. Screwdriver, Phillips-head
2. Screwdriver, 3 mm ($\frac{1}{8}$ ") blade
3. Pliers, long-nose
4. Diagonal cutters
5. Wrench, adjustable
6. Tweezers
7. Soldering iron, 40 to 50 watts
8. Soldering iron, solder-sucker tip
9. Solder, rosin core

2-2. HARDWARE IDENTIFICATION GUIDE

The following chart will help you to decipher the hardware codes given in this service manual.

Note: All screws in this set are manufactured to the specifications of the International Organization for Standardization (ISO). This means that the new and old screws are not interchangeable because ISO screws have a different number of threads per mm compared to the old ones. The ISO screws have an identification mark on their heads as shown in Fig. 2-1.

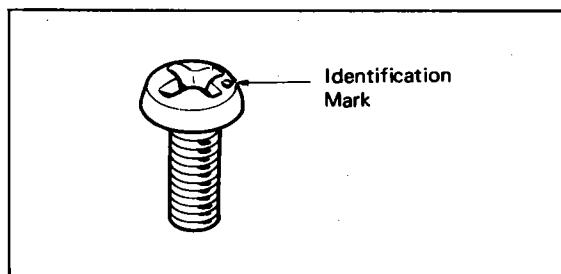

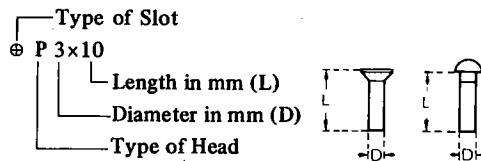

Fig. 2-1. ISO screw

Hardware Nomenclature

P	Pan Head Screw		
PS	Pan Head Screw with Spring Washer		
K	Flat Countersunk Head Screw		
B	Binding Head Screw		
RK	Oval Countersunk Head Screw		
T	Truss Head Screw		
R	Round Head Screw		
F	Flat Fillister Head Screw		
SC	Set Screw		
E	Retaining Ring (E Washer)		
W	Washer		
SW	Spring Washer		
LW	Lock Washer		
N	Nut		

Example

2-3. TOP COVER AND FRONT PANEL REMOVAL

1. Remove the two machine screws at each side of the case and lift off the top cover.
2. Remove all control knobs and levers. The knobs can be removed by loosening the slotted set screws and pulling the knobs straight out. The levers are simply pulled off.
3. Remove the four self-tapping screws (\oplus B 3x6) securing the front subchassis's top cover and lift off it. See Fig. 2-2.
4. Remove the three screws (\oplus PS 4x5) behind the top edge of the front subchassis as shown in Fig. 2-3.
5. Remove the three self-tapping screws (\oplus B 3x6) at the front bottom of the chassis as shown in Fig. 2-4. This frees the front panel.

Fig. 2-2. Front subchassis's top cover removal

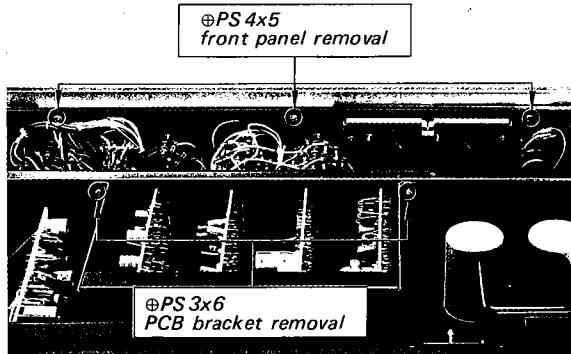

Fig. 2-3. Front panel and PCB bracket removal

2-4. FRONT SUBCHASSIS REMOVAL

The front subchassis is the vertical member on which the controls, switches, and the pilot lamps are attached.

1. Remove the top cover and front panel as described in Procedure 2-3.

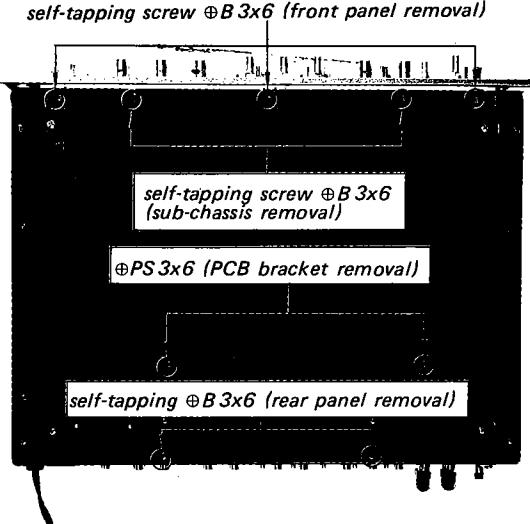

Fig. 2-4. Bottom view

2. Remove the two self-tapping screws ($\oplus B\ 3\times 6$) at each side of the chassis (see Fig. 2-5) and two self-tapping screws ($\oplus B\ 3\times 6$) at the front bottom of the chassis as shown in Fig. 2-4. This frees front subchassis.

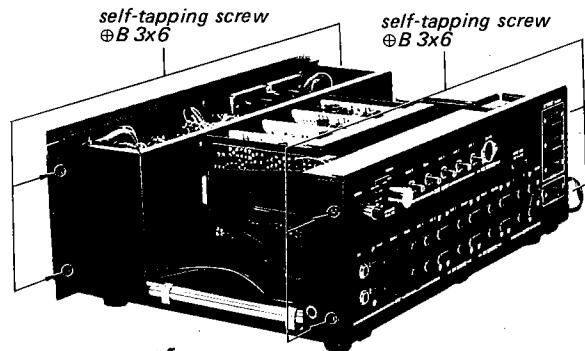

Fig. 2-5. Front-subchassis and rear panel removal

2-5. LEVEL METER AND METER LAMP REPLACEMENT

1. Remove the front subchassis as described in Procedure 2-4.
2. Remove the four screws ($\oplus PS\ 3\times 6$) securing the meter bracket to the front subchassis as shown in Fig. 2-6. This frees the meter bracket.
3. Remove the defective level meter or meter lamp by loosening the hex nut or prying out the defective lamp, and then install the new one.

2-6. PC BOARD REMOVAL

Prepare for removing or replacing any of the PC boards by removing the top cover as described in Procedure 2-3.

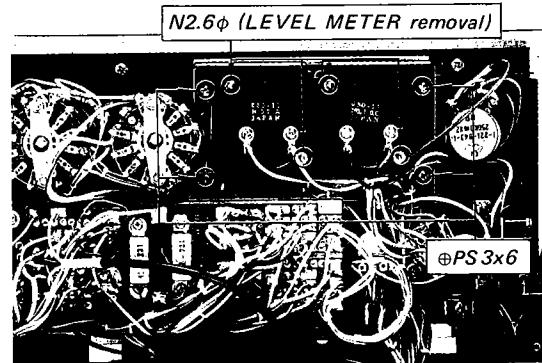

Fig. 2-6. Meter bracket removal

PHONO-1 Equalizer Amplifier/Head Amplifier Board

1. Remove the IMPEDANCE SELECTOR knob by loosening the set screw.
2. Remove the hex nut securing the IMPEDANCE SELECTOR switch to the rear panel.
3. Remove the three screws (\oplus PS 3x6) securing the PCB bracket to the rear panel cover. This frees the PCB.

Plug-in Type PCB

1. Remove the two screws (\oplus PS 3x6) securing the PCB bracket to the PCB mounting bracket as shown in Fig. 2-3.
2. Remove the two screws (\oplus PS 3x6) securing the PCB mounting bracket to the chassis from the bottom as shown in Fig. 2-4.
This frees the bracket, and now the PCB's can be simply pulled out.

REC OUT Buffer/High and Low Filter Component/Turnover Frequency Changeover Component Board

1. Remove the front subchassis as described in Procedure 2-4.
2. Remove the two screws (\oplus PSW 3x6) securing the PCB to the front subchassis as shown in Fig. 2-7.

OUTPUT LEVEL Changeover Switch Board

1. Remove the rear panel as described in Procedure 2-7.
2. Remove the two screws (\oplus B 2.6x4) securing the OUTPUT LEVEL changeover switch to the rear panel as shown in Fig. 2-8.

Note: This board is directly soldered to the OUTPUT LEVEL changeover switch.

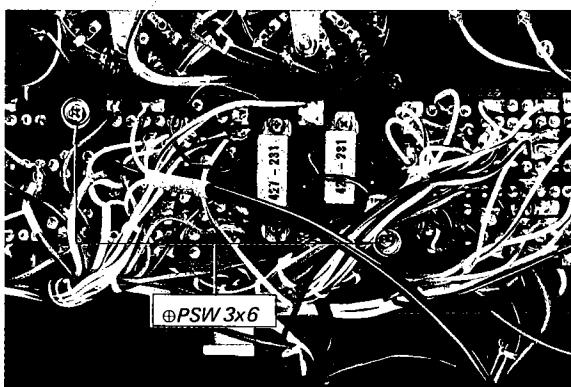

Fig. 2-7. PC board removal

2-7. REAR PANEL REMOVAL

1. Remove the PHONO-1 Equalizer Amplifier/Head Amplifier Board as described in Procedure 2-6.
2. Remove the two self-tapping screws (\oplus B 3x6) at each side of the rear panel as shown in Fig. 2-5.
3. Remove the two self-tapping screws (\oplus B 3x6) at rear edge of the bottom as shown in Fig. 2-4. This frees the rear panel.

2-8. CONTROL AND SWITCH REPLACEMENT

Prepare for replacing any of the controls or switches by removing the front panel and front subchassis or rear panel as described in Procedures 2-4 and 2-7.

POWER, FUNCTION-2, MONITOR, TURNOVER FREQ. and TONE CANCEL Switches

1. Remove the two screws securing switches to the front subchassis as shown in Fig. 2-9.
2. Unsolder the lead wires from the defective switch, and then install the replacement switch. Note that the PCB mounted at the back of the front subchassis should be removed when replacing the TURNOVER FREQ. or TONE CANCEL switch.

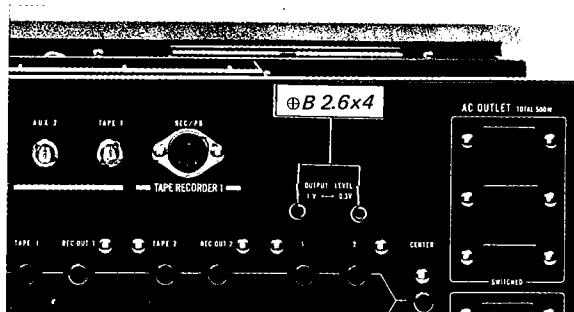

Fig. 2-8. Rear view

FUNCTION-1, MODE, FILTER LEVEL Switches and VOLUME, HEADPHONE LEVEL, BALANCE, BASS, TREBLE and MIC LEVEL Controls

1. Remove the hex nut that secures the defective switch or control to the front subchassis as shown in Fig. 2-9.
2. Unsolder the lead wires from the defective switch or control and then install the new one.

HEADPHONE, AUX-3 jacks

1. Remove the two screws (\oplus PS 3x6) securing the jack escutcheon to the front subchassis.
2. Unsolder the lead wires from the defective jack, and then install the new one.

LEVEL ADJUST Controls and MIC Jack

1. Remove the ornamental nut securing the controls or jack to the rear panel. Use pliers covered with a soft cloth. Take care not to mar the rear panel.
2. Unsolder the lead wires from the defective control or jack, and then install the new one.

IMPEDANCE SELECTOR Switch

1. Remove the PHONO-1 Equalizer Amplifier/ Head Amplifier Board as described in Procedure 2-6.

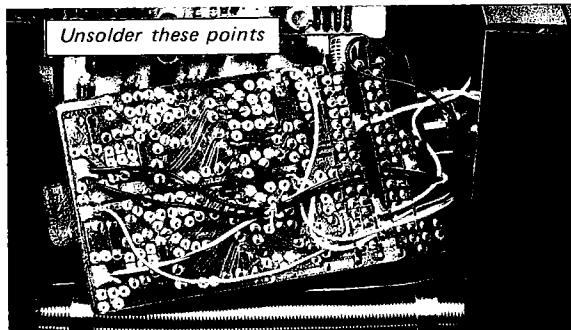

Fig. 2-10. IMPEDANCE selector switch removal

2. With a soldering-iron having a solder-sucking tip, clean the solder from each lug of the defective switch and the printed board as shown in Fig. 2-10. This frees the switch.

3. Install the replacement switch.

2-9. REPLACEMENT OF COMPONENTS SECURED TO THE REAR PANEL BY RIVETS

1. Remove the rear panel as described in Procedure 2-7.
2. Bore out the rivets using a drill bit slightly larger in diameter than the rivet. See Fig. 2-11.
3. Punch out the remainder of the rivet with a nail set or prick punch.
4. Remove the defective component, and then install a new one.
5. Secure the new component with a suitable screw and nut, or a repair rivet screw (part number 3-701-402).

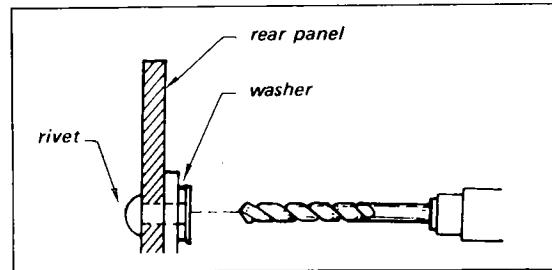

Fig. 2-11. Rivet replacement

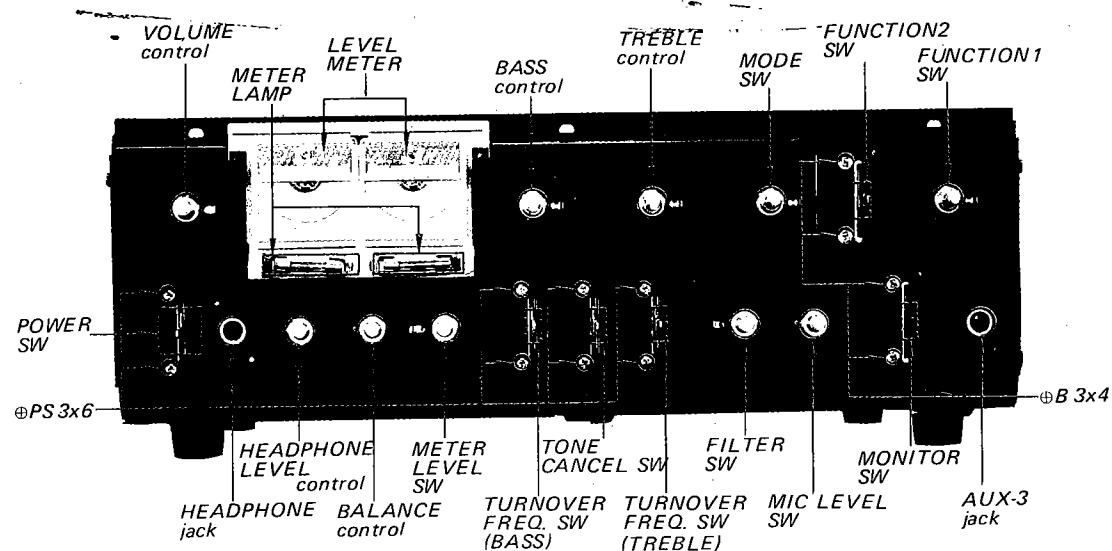

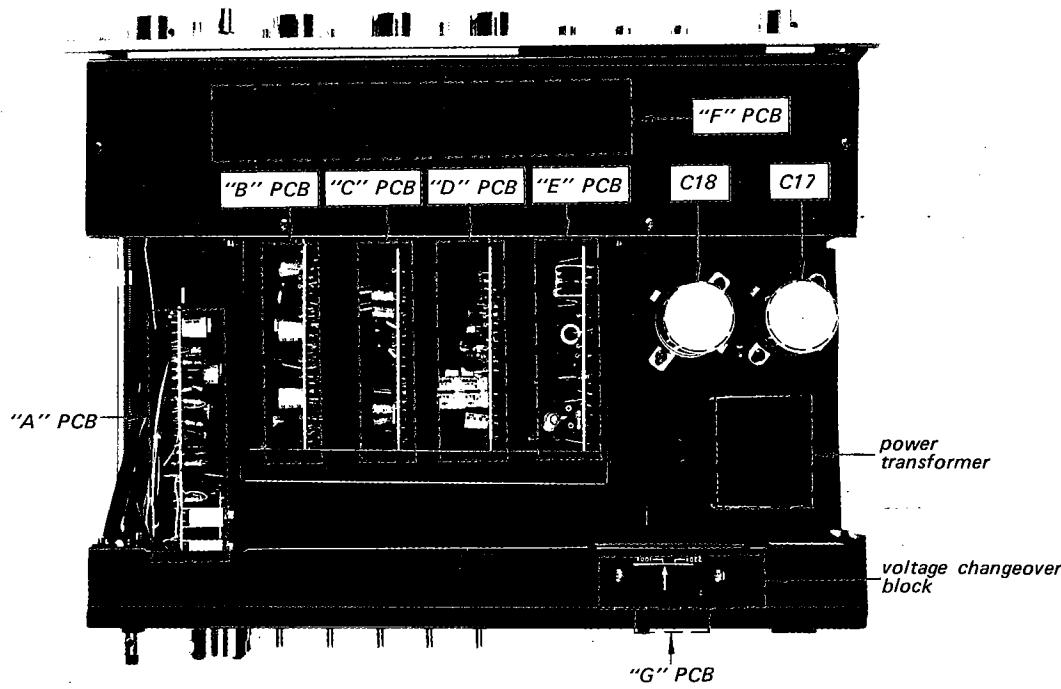

Fig. 2-9. Control and switch replacement

SECTION 3

ALIGNMENT AND ADJUSTMENT PROCEDURES

3-1. TEST EQUIPMENT REQUIRED

1. Audio Oscillator
Frequency range 10 Hz to 100 kHz
Distortion 0.03% or less at 1kHz
2. Distortion Meter
Capable of measuring of 0.015% distortion or less at 1kHz
Frequency range 20 Hz to 100 kHz
Input impedance 1 megohm or more
3. Ac VTVM
Capable of measuring rms voltage of 100 mV or less with a frequency range from 10 Hz to 100 kHz.
Input impedance 500k ohms or more
4. Attenuator
Capable of attenuating signals 60 dB or more.
Characteristic impedance 600 ohms unbalanced
5. Oscilloscope
Bandwidth 1 MHz or more
6. Dc Voltmeter
Capable of measuring dc voltage of 150V and 50V or less.
7. Resistors 600 ohm ($\frac{1}{4}$ W)
 3 ohm ($\frac{1}{4}$ W)

Note: 1. When measuring the sensitivity of the PHONO-1 LOW LEVEL input, insert a 46 dB pad (shown in Fig. 3-1.) between the attenuator and input terminal. The input sensitivity may be regarded as the reading on the attenuator plus the pad-loss.
2. 0 dB = 0.775V (r.m.s.)

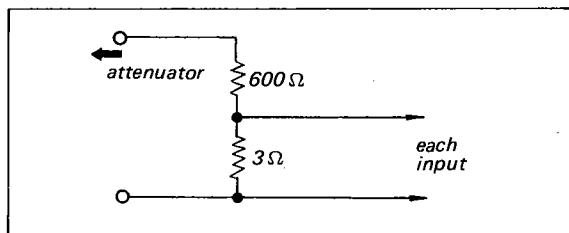

Fig. 3-1. 46 dB pad

3-2. POWER SUPPLY VOLTAGE ADJUSTMENT

Check the power supply voltages before starting any measurements and readjust them if necessary.

Preparation

1. Remove the top cover as described in Procedure 2-3 and connect the dc voltmeter to the test points as shown in Fig. 3-2.

Procedure

1. Set the variable transformer for minimum output.
2. Turn the POWER switch to ON, and then increase the line voltage up to the rated value.
3. Adjust semifixed resistor R920 (high-voltage regulator) and R926 (low-voltage regulator) to obtain 150V and 37V readings respectively on the meter.

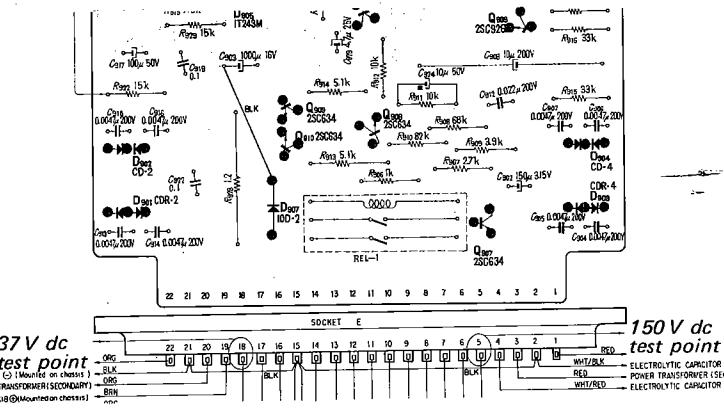

Fig. 3-2. Dc voltmeter connections

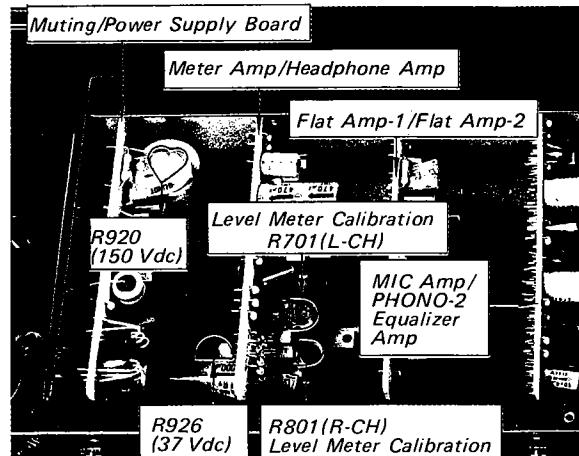

Fig. 3-3. Parts location

3-3. OVERALL CHECK PREPARATION

Unless otherwise specified, set all controls and switches as follows to prepare for the following checks:

VOLUME control	maximum position
MODE switch	STEREO
MONITOR switch	SOURCE
MIC LEVEL control	MIXING OFF
FILTER switch	OFF
TREBLE control	0 (dB)
BASS control	0 (dB)
TONE switch	CANCEL
TREBLE TURNOVER	
FREQ. switch	2.5 kHz
BASS TURNOVER	
FREQ. switch	500 Hz
METER LEVEL switch	0 (dB)
HEADPHONE LEVEL	
control	minimum level
BALANCE control	mid position
LEVEL ADJUST control ..	maximum level (rear panel)
OUTPUT LEVEL switch ...	1 V (rear panel)
IMPEDANCE	
SELECTOR switch	47 k (rear panel)

3-4. SENSITIVITY MEASUREMENT

Preparation

1. Set all the controls as described in Procedure 3-3.
2. Set the FUNCTION-1, IMPEDANCE SELECTOR, and FUNCTION-2 switches to the position where the measurement should be performed.

3. Set the BALANCE control to fully counterclockwise (left-channel measurement) or fully clockwise (right-channel measurement) position.

Procedure — Perform this for each input

1. With the equipment connected as shown in Fig. 3-4, feed a 1 kHz signal to the input jack. Adjust the attenuator to obtain a 1 volt reading on the ac VTVM. Note that the audio oscillator's output should always be kept at 0.775 volts (0 dB).
2. The reading of the attenuator represents the input sensitivity and should within the limits given in Table 3-1.

TABLE 3-1. INPUT SENSITIVITY

INPUTS	SPECIFIED SENSITIVITY AT 1 kHz
PHONO-1 (HIGH LEVEL) *(LOW LEVEL)	-57 ±1 dB -82.2 ±1.5 dB
PHONO-2	-57 ±1 dB
MIC	-63.7 ±1.5 dB
TUNER, AUX-1, -2, -3	-17.5 ±0.5 dB

* The PHONO-1 IMPEDANCE SELECTOR switch should be set to 30Ω and an additional attenuator pad (See Fig. 3-1.) used between the main attenuator and input jack.

3-5. LEVEL METER (VU meter) CALIBRATION

Preparation

1. Set the FUNCTION-2 switch to TUNER.
2. Set the BALANCE control fully counterclockwise (left-channel calibration) or fully clockwise (right-channel calibration).
3. Set the METER LEVEL switch to 0 dB.

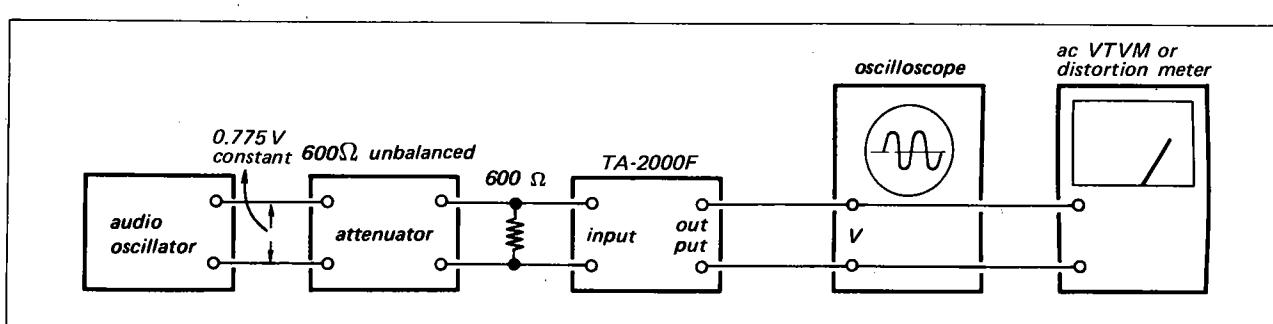

Fig. 3-4. Level check test setup

Procedure

- With the equipment connected as shown in Fig. 3-4, feed a 1 kHz to the TUNER input jack. Adjust the attenuator to obtain a 1 volt reading on the ac VTVM.
- Turn the semifixied resistor R701 (R801), see Fig. 3-3, mounted on the Meter Amplifier/Headphone Amplifier board to obtain a 0 reading on the level meter.
- Decrease the input signal level 10 dB (20 dB), and then set the METER LEVEL switch to -10 dB (-20 dB) position.
- Confirm that the reading on the level meter is 0 ± 0.5 VU.
- Confirm that the reading of the meter changes with variations in attenuator settings.

3-6. RATED OUTPUT MEASUREMENT**Preparation**

- Set the FUNCTION-2 switch to TUNER.
- Set the BALANCE control fully counterclockwise (left-channel calibration) or fully clockwise (right-channel calibration).
- Set the OUTPUT LEVEL switch to 1V.
- Set the HEADPHONE LEVEL control to maximum level position.

Procedure

- With the equipment connected as shown in Fig. 3-4, feed a 1 kHz to the TUNER input jack. Adjust the attenuator to obtain a 1 volt reading on the ac VTVM.
- Each output level should be within the limits given in Table 3-2.

TABLE 3-2. OUTPUT LEVEL

Outputs	Output Level
CENTER OUTPUT	16.0 ± 1 dB
HEADPHONE OUT (open)	16.0 ± 1 dB
REC OUT	-17.5 ± 1 dB
REC/PB OUT 1 or 4 to ground see Fig. 3-5.	-32 ± 3 dB

3-7. HARMONIC-DISTORTION MEASUREMENT**Preparation**

Same as described in Procedure 3-3, except the TONE switch should be set to ON.

Procedure

- With the equipment connected as shown in Fig. 3-4, feed in the signal specified in Table 3-3 and then adjust the VOLUME control to obtain a 1 volt (r.m.s.) output.
- Measure the harmonic distortion. The harmonic distortion should be within the limits given in Table 3-3.

TABLE 3-3. HARMONIC DISTORTION

Inputs	Input Signal Level and Freq.	Harmonic Distortion
PHONO-1 (HIGH LEVEL) or PHONO-2	-18 dB, 1 kHz -8 dB, 1 kHz	0.05% or less 0.1% or less (at 3 vols output)
*MIC	3 dB, 1 kHz	0.7% or less (at 3 vols output)
TUNER, AUX-1, 2, 3	-17.5 ± 0.5 dB, 1 kHz	0.03% or less

* Note: In this measurement, adjust the output level by means of the MIC LEVEL control.

3-8. FREQUENCY RESPONSE MEASUREMENT**Preparation**

Same as Procedure 3-4.

Procedure — Perform this for each input.

- With the equipment connected as shown in Fig. 3-4, feed a 1 kHz signal to the input jack. Vary the attenuator to obtain a 1 volt reading on the ac VTVM.
- Check the frequency response by varying the input signal frequency while keeping the oscillator's output constant. Frequency response should be within the limits as given in Table 3-4.

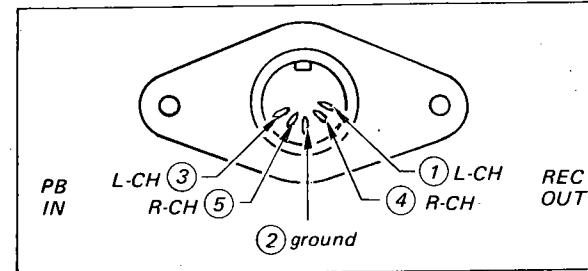

Fig. 3-5. REC/PB (DIN) connector

TABLE 3-4. FREQUENCY RESPONSE

Inputs	*Specified Frequency Response
TUNER	$\pm\frac{1}{2}$ dB at 10 Hz $\pm\frac{1}{2}$ dB at 100 kHz
PHONO-1 (HIGH LEVEL) (47k)	13.1 \pm 0.5 dB at 100 Hz
or (LOW LEVEL) (30 ohm)	-13.7 \pm 0.5 dB at 10 kHz
MIC (MIC LEVEL control: maximum)	$\pm\frac{1}{2}$ dB at 30 Hz $\pm\frac{1}{2}$ dB at 30 kHz
TUNER	CENTER OUTPUT $\pm\frac{1}{2}$ dB at 20 Hz $\pm\frac{1}{2}$ dB at 20 kHz

* referred to 1 kHz 1 volt output

3-9. NOISE LEVEL MEASUREMENT

Preparation

1. Same as described in Procedure 3-3 except set the FILTER switch to LOW and the TONE switch to ON.
2. Turn the VOLUME control fully clockwise.

Procedure

1. With the equipment connected as shown in Fig. 3-6, measure the output noise level at each FUNCTION switch position, with the corresponding input terminals shorted.

TABLE 3-5. NOISE LEVEL SPECIFICATIONS

Inputs	Noise Level
TUNER	-70 dB or less
PHONO-1 (HIGH LEVEL) (47 k ohm)	-57 dB or less
PHONO-1 (LOW LEVEL) (30 ohm)	-40 dB or less
PHONO-2	-57 dB or less
MIC	-35 dB or less

Note: The difference between left and right channel noise levels should be 4 dB or less. The average noise levels are given in Table 3-5.

3-10. TONE CONTROL CHECK

Preparation

1. Set all controls as described in Procedure 3-3, except set the TONE switch to ON.
2. Set the FUNCTION-2 switch to TUNER.

Procedure

1. With the equipment connected as shown in Fig. 3-4, feed a 1 kHz signal to the TUNER input jack. Vary the attenuator to obtain a 1 volt reading on the ac VTVM.
2. Check the frequency response by varying the BASS, TREBLE controls and the input signal frequency while keeping the oscillator's output constant. TONE control response should be as given in Table 3-6.

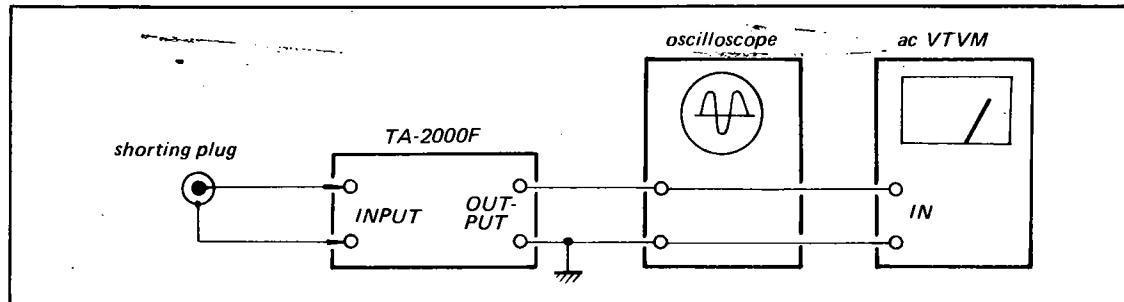

Fig. 3-6. Noise level check test setup

TABLE 3-6. TONE CONTROL CHECK

Inputs	Controls	Specified Frequency Response
TUNER	BASS (Turnover Freq. 500 Hz)	± 10 dB* maximum, 2 dB step at 100 Hz
	TREBLE (Turnover Freq. 2.5 kHz)	± 10 dB* maximum, 2 dB step at 10 kHz
Same as above	BASS (Turnover Freq. 250 Hz)	± 10 dB* maximum, 2 dB step at 50 Hz
	TREBLE (Turnover Freq. 5 kHz)	± 10 dB* maximum, 2 dB step at 20 kHz

* referred to 1 volt at 1 kHz.

3-11. FILTER RESPONSE CHECK

Preparation

- Set all controls as described in Procedure 3-3.
- Set the FUNCTION-2 switch to TUNER.

Procedure

- With the equipment connected as shown in Fig. 3-3, feed a 1 kHz signal to the TUNER input jack. Vary the attenuator to obtain a 1 volt reading on the ac VTVM.
- Check the frequency response by operating the FILTER switch and varying the input signal frequency. Keep the oscillator's output constant. Filter response should be within the limits given in Table 3-7.

TABLE 3-7. FILTER RESPONSE CHECK

FILTER SW Position	Specified Frequency Response
LOW or BOTH	* -3 ± 1.5 dB at 50 Hz
HIGH or BOTH	* -3 ± 1 dB at 9 kHz

* referred to 1 kHz 1 volt output.

3-12. CROSSTALK MEASUREMENT

Preparation

- Set all the controls as described in Procedure 3-3, except set the TONE switch to ON position.
- Set the FUNCTION-2 switch to TUNER.

Procedure

- With equipment connected as shown in Fig. 3-3, feed a 1 kHz signal to the TUNER input jack (left channel). Vary the attenuator to obtain a 1 volt reading on the ac VTVM.
- Switch the signal to the right-channel input jack while shorting the left-channel input.
- Read the residual signal level in the left-channel output. The 1 volt output-level to residual-level ratio represents the channel crosstalk. The left-to-right and right-to-left crosstalk should be 60 dB or more.

SECTION 5 REPACKING

The TA-2000F's original shipping carton and materials are the ideal container for shipping unit. However to secure the maximum protec-

tion, the TA-2000F must be repacked in these materials precisely as before. The proper repacking procedures are shown in Fig. 5-1.

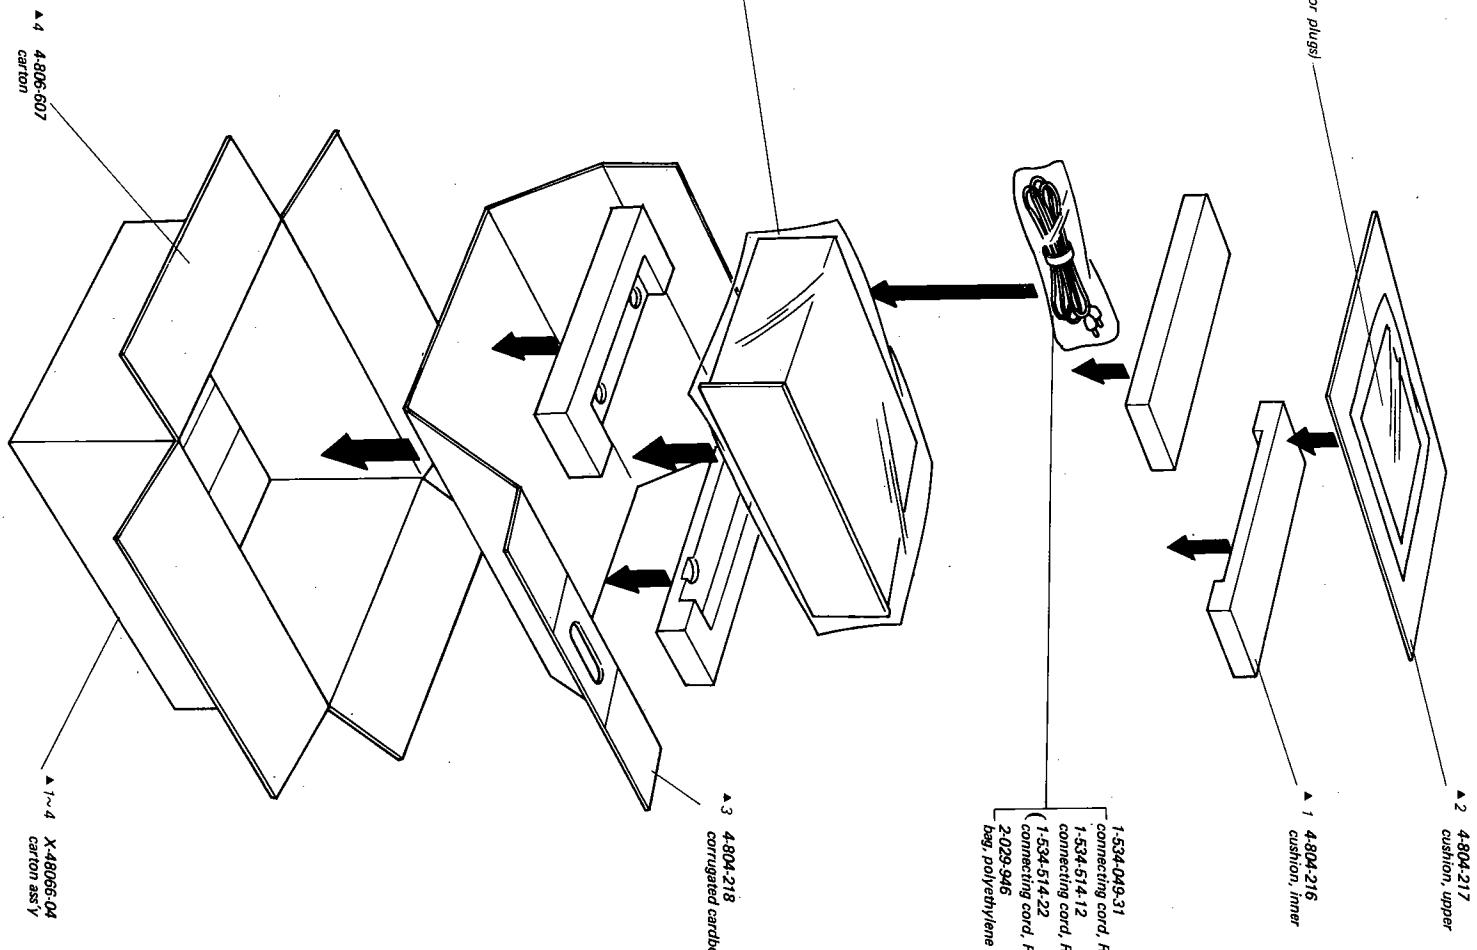

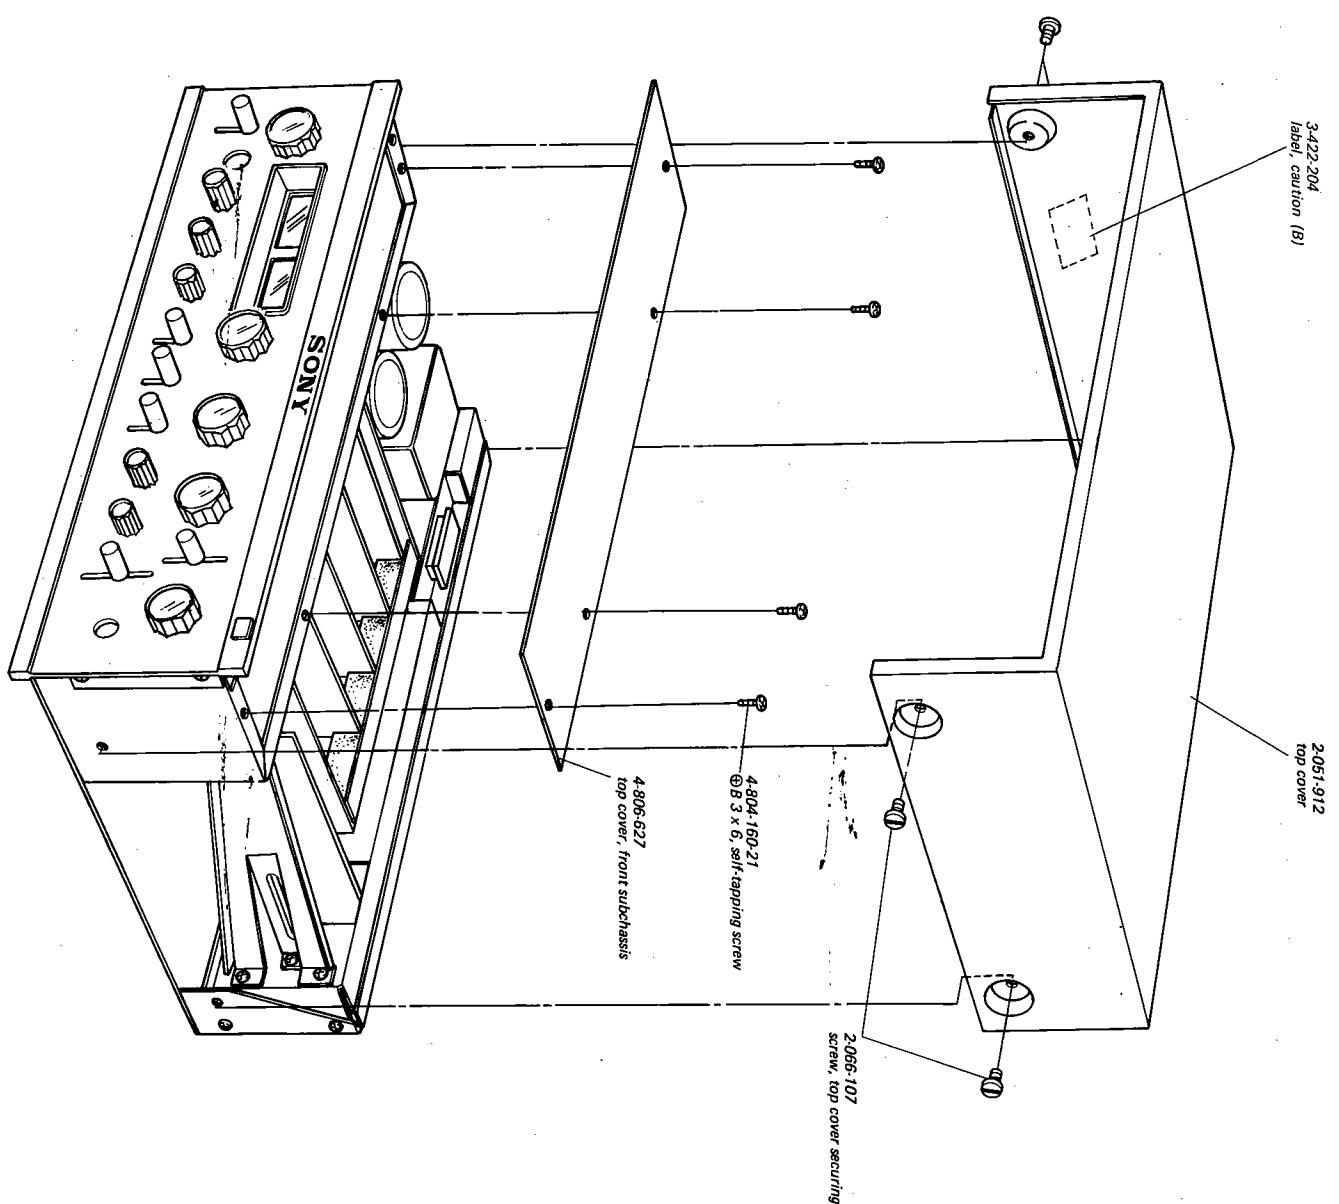

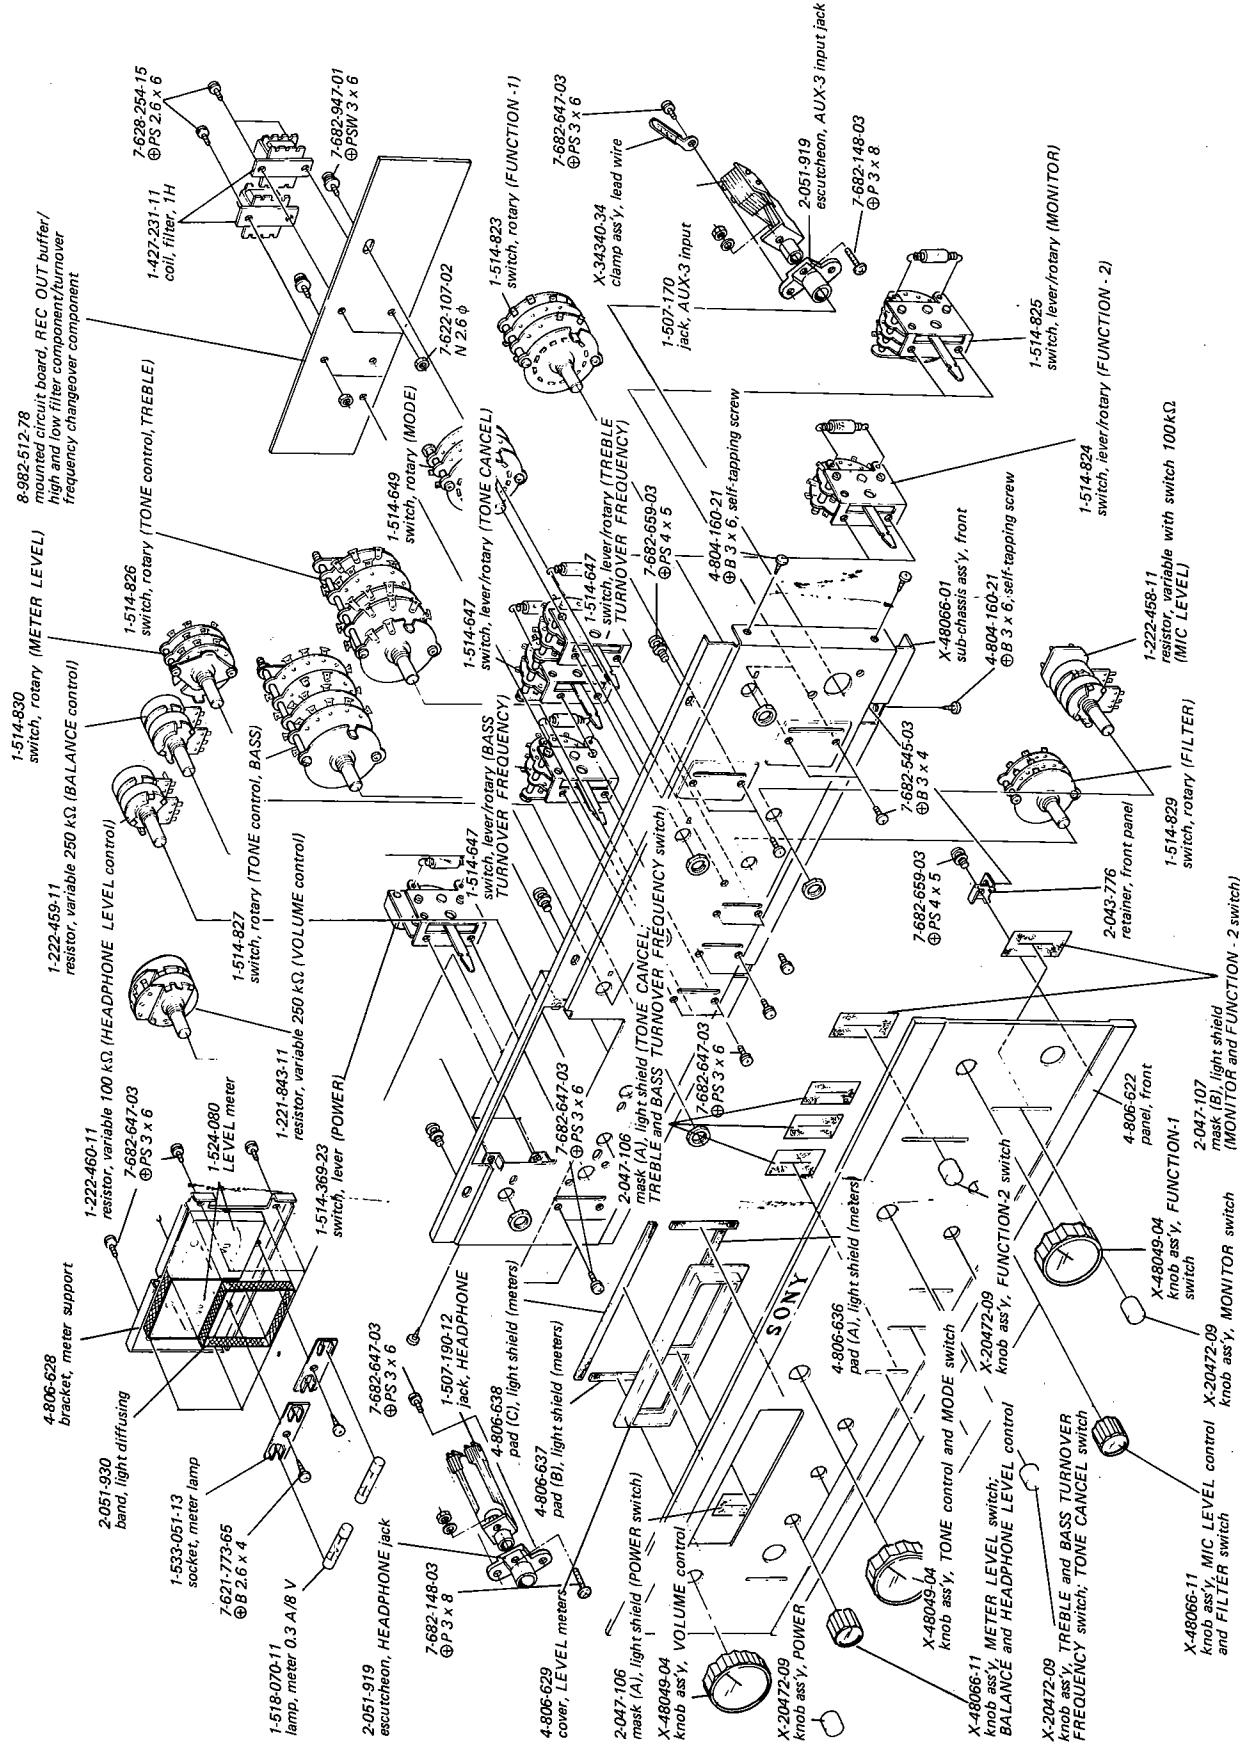

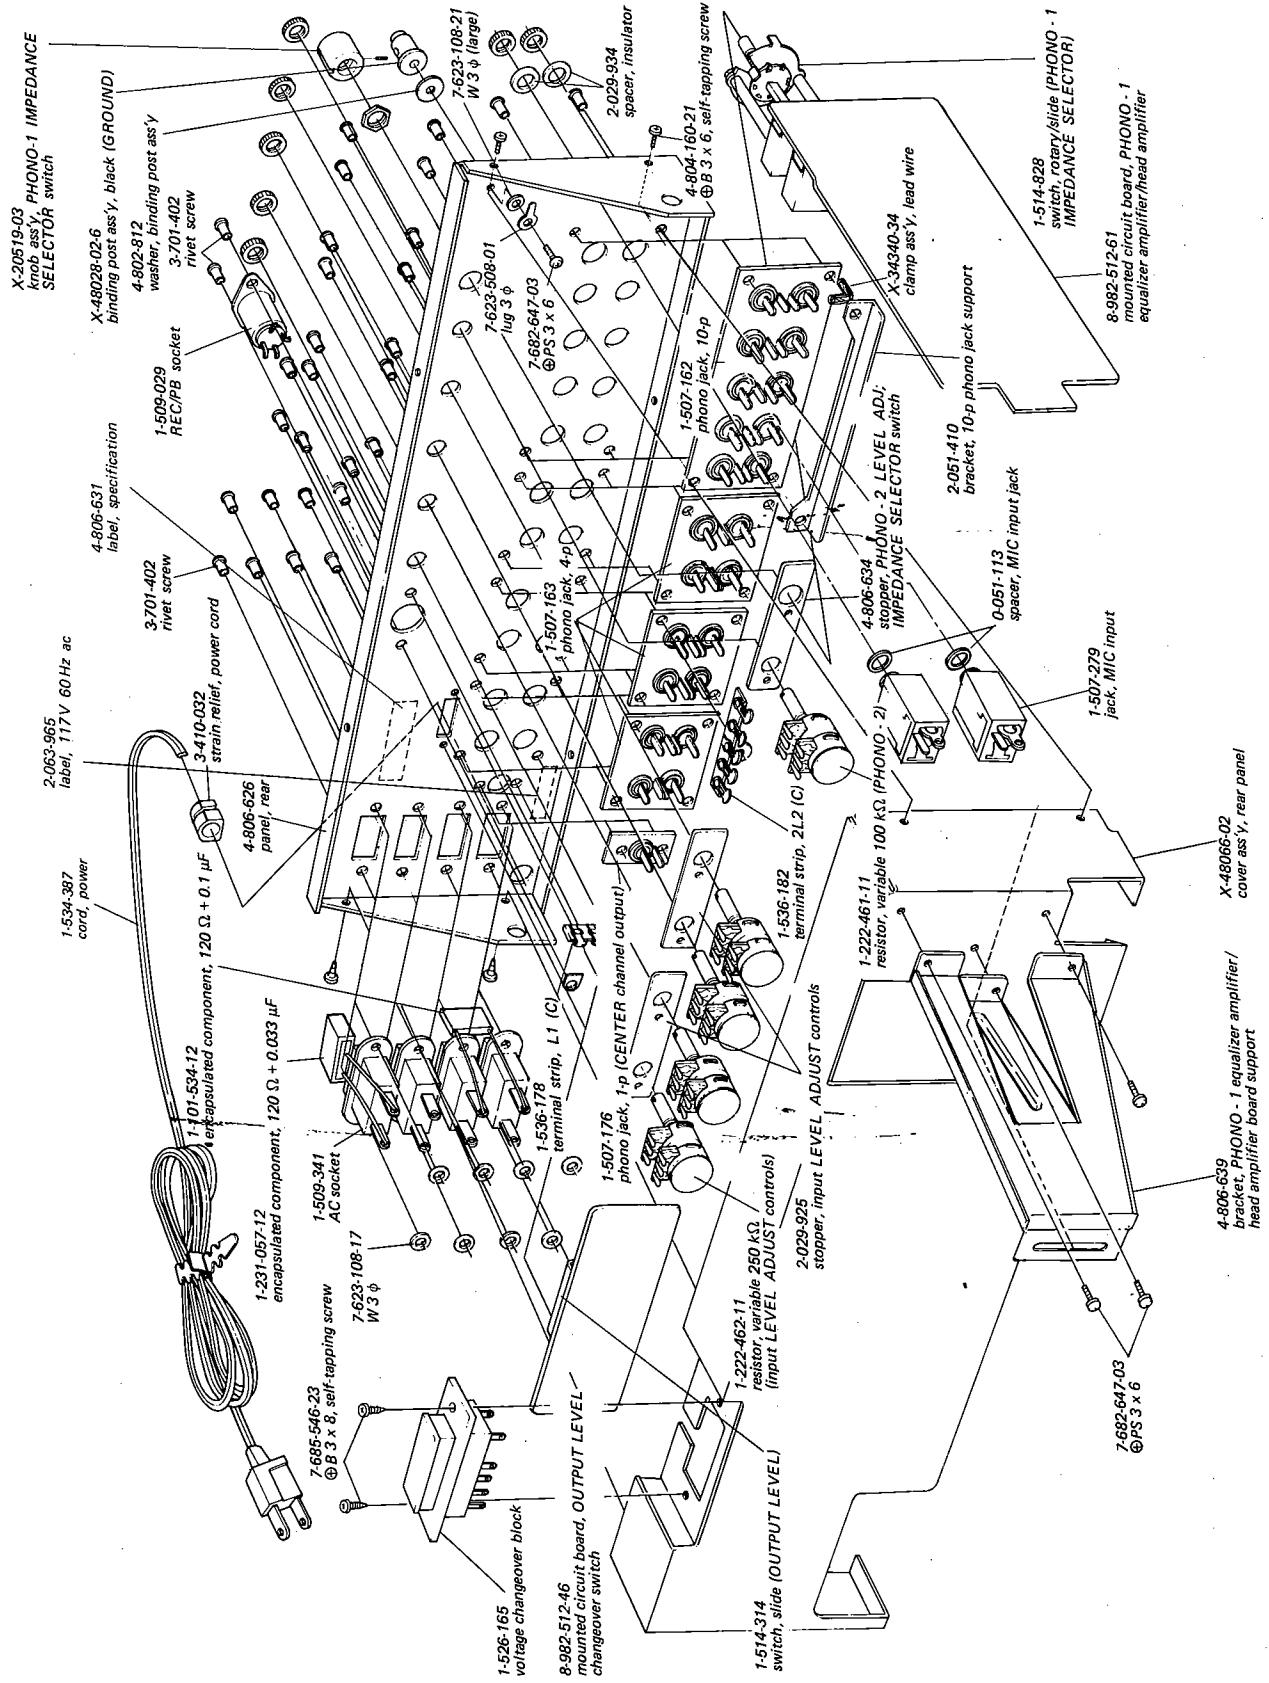

Fig. 5-1. Repacking

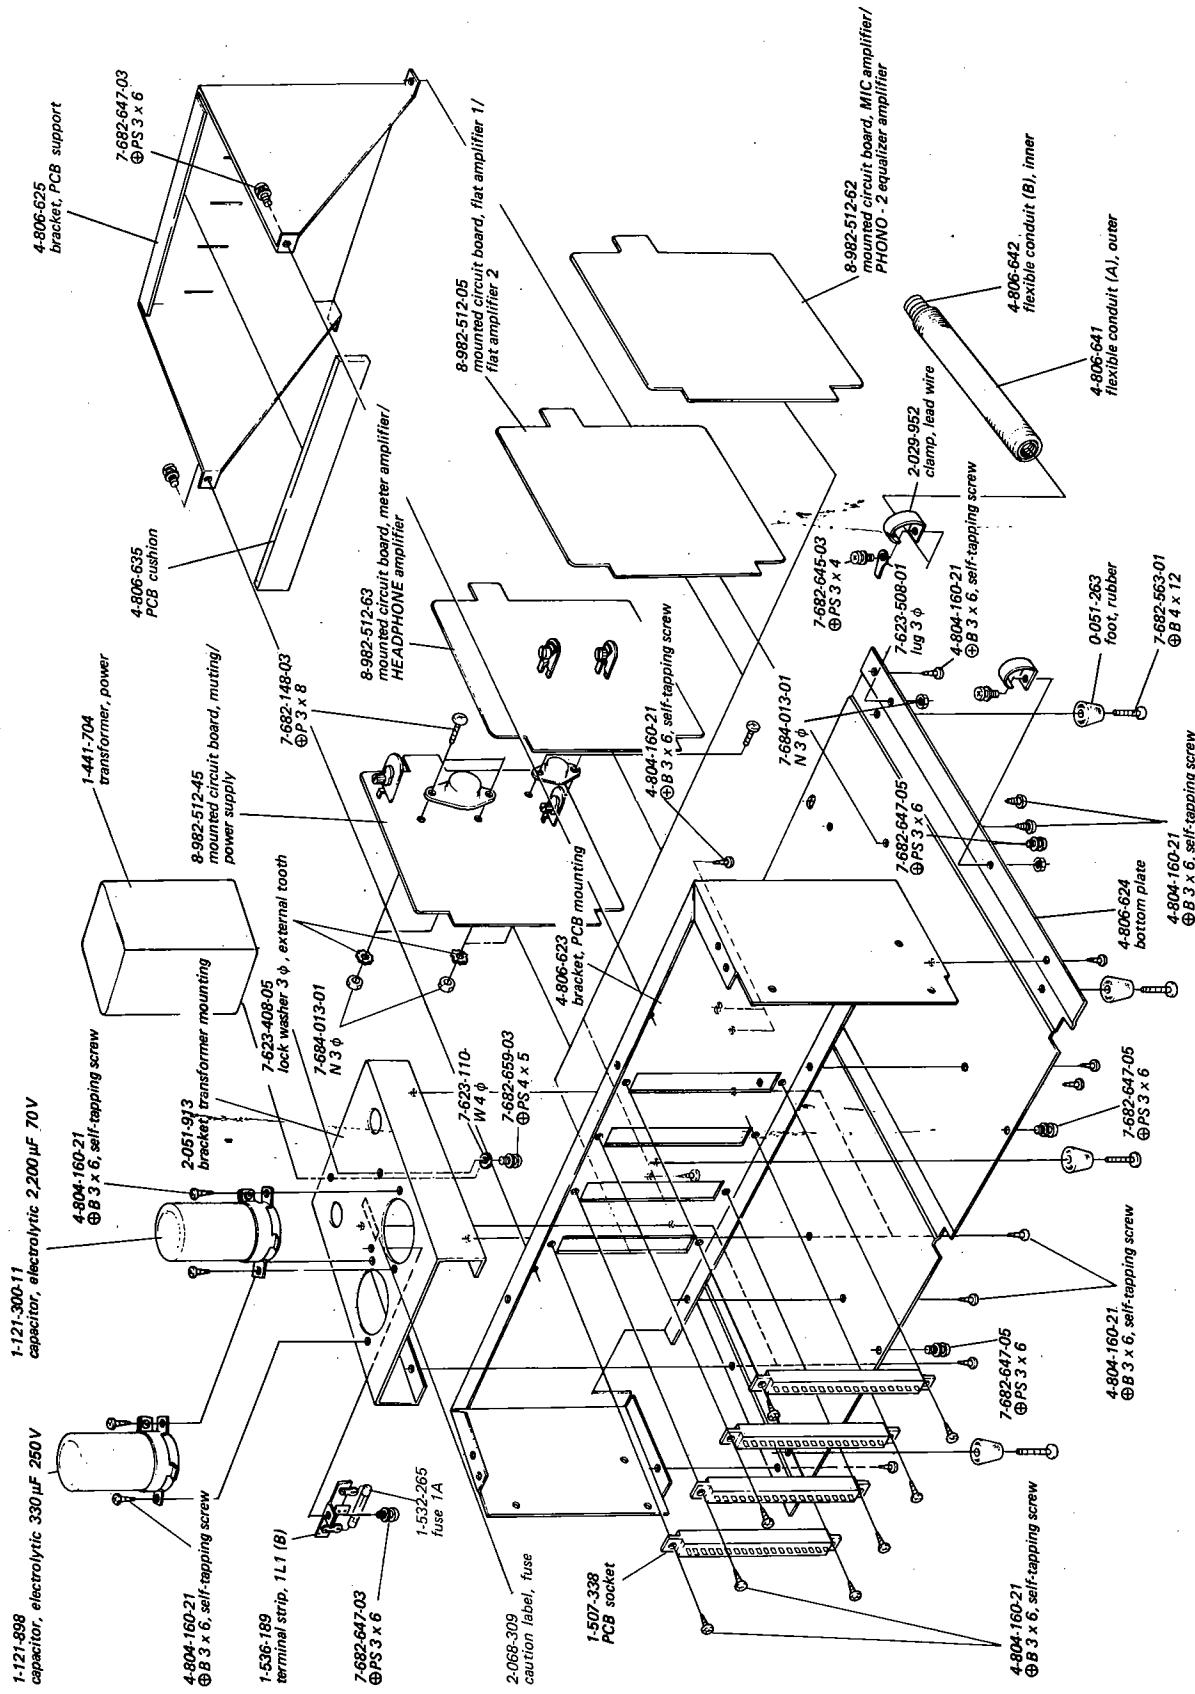

Note: Carton ass'y includes all the parts marked ▲

RESISTORS									
All resistance values are in ohms, $\pm 5\%$, $\frac{1}{4}$ watts and carbon type unless otherwise indicated.									
Note that the suffix "09" in the Parts Numbers indicates noiseless type.

SERVICE MANUAL SUPPLEMENT

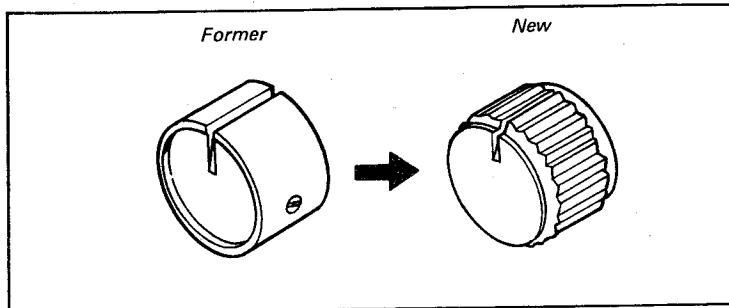

Subject: Changes on Model TA-2000F and Service Manual Correction

1. INTRODUCTION

SONY has changed the design of knobs equipped in TA-2000F as given in Table below. Note that the new knob is a serrated type as illustrated. In addition, some transistors are changed in the amplifier section. Notice that there is printing error concerning Idss rank illustration in the service manual. To avoid confusion make the following correction.

2. DESCRIPTION OF THE MODIFICATIONS

2-1. NEW KNOB

**TABLE 1. PARTS CHANGED**

<i>Description</i>	<i>Parts Number</i>	
	<i>Former</i>	<i>New</i>
VOLUME, TONE(BASS, TREBLE) control knobs, FUNCTION, MODE switch knobs	X-20299-04	X-48049-04
BALANCE control knob, HEADPHONE, METER, FILTER, MIC LEVEL knobs, IMPEDANCE SELECTOR knob	X-20519-03	X-48066-11

Applicable Serial Numbers

500,201 and later

Interchangeability

New and old knobs are not interchangeable.
