# POWER FACTOR CORRECTION

Get energized with us

ZEZ SILKO s.r.o. is a reputable manufacturer of power capacitors, capacitors for power electronics, capacitors for induction heating and many other capacitor types. Company ZEZ SILKO s.r.o. provides complete power factor correction service including: power system evaluation including harmonic analysis, technical and commercial quotations, capacitor banks production and commissioning. Components for power factor correction and regulation of electrical energy are also supplied. ZEZ SILKO products are being exported to countries all around the world. They are for use on traction systems (locomotives, trams, trolleybuses), green energy generation (wind and photovoltaic power plants), energy sector (power factor correction) and also induction heating equipment.

ZEZ SILKO s.r.o. has always been and will continue to be your reliable business partner.

- **European manufacturer of capacitors**
- **Tradition of capacitor production since 1934**
- **Emphasis to quality of products**
- **Quality control system (ISO 9001) since 1999**
- **IRIS certification since 2014**
- **Products are exported to countries all around the world**

- More than 80 years of experience
- Own R&D department
- Own laboratories and testing rooms
- Complete product range
- Ready to develop tailor made products
- High quality European product
- Short delivery time
- Skilled technical support

COMPANY PROFILE.....	3
POWER FACTOR CORRECTION.....	6 - 7

## LV PFC

### CAPACITORS

- Low voltage power capacitors..... 8 - 9
  - N – Normal..... 10 - 13
  - HD – Heavy Duty..... 14 - 17

- Low voltage capacitor banks..... 38
- Medium voltage capacitor banks..... 39

# POWER FACTOR CORRECTION

## Basic characteristics

Many electrical devices, equipments and systems needs an electromagnetic field for their standard operation. This physical necessity leads to a consumption of reactive power which is used to provide basic function but not any active power. It means that transmission and distribution system is loaded with this reactive power and that's not an economically effective use and therefore it's penalized by electrical utility companies. The solution is to use local power factor compensation to provide the required reactive power from power capacitors directly to the appliance to avoid undesired load of the mains network.

Systems with higher harmonics content may be sensitive to create resonant circuit between power capacitors and inductance of a transformer and may cause damage of an electrical system. The solution is to use detuned PFC which combines power capacitors with detuning reactors. This detuned system shifts the resonance frequency to lower values (below first harmonic) where no harmonics are present so the safe operation of the whole system is ensured. Besides this such circuit has a certain tuning frequency that offers a filtering effect for the harmonic currents and thanks to this reduces the distortion level in the grid system.

Note that detuning reactors and their inductance must be selected to match exactly capacitor capacitance to obtain the desired tuning frequency. Also note the capacitor is exposed to increased voltage than the nominal grid voltage in detuned PFC systems because of series connection with detuning reactor.

## Application

Intended for individual, group or central power factor correction.

Example of detuned PFC system with basic components:

- Contactors
- PFC controllers
- Detuning reactors
- Power capacitors

## Calculation table and formula for required reactive power

0,95							0,04	0,08	0,13	0,19	0,33

$$Q_C = P \cdot k = P \cdot (\tan\varphi_1 - \tan\varphi_2)$$

$$P = S \cdot \cos\varphi$$

- Q<sub>C</sub> - Reactive power of the required power capacitor
- P - Active power of the load to be corrected
- k - conversion coefficient
- φ<sub>2</sub> - original cosφ
- φ<sub>1</sub> - target cosφ

## Calculation example

Load power P = 100 kW  
 Original cosφ<sub>1</sub> = 0,75  
 Target cosφ<sub>2</sub> = 0,95  
 k coeff. (from table) = 0,55

Capacitor reactive power Q<sub>C</sub>:

$$Q_C = P \cdot k = 100 \cdot 0,55 = 55 \text{ kvar}$$

## Basic formulas for detuned power factor correction

$$U_C = \frac{U_N}{1 - \frac{p}{100\%}}$$

$$p = \frac{X_L}{X_C} \cdot 100\%$$

$$f_r = f_N \cdot \sqrt{\frac{100\%}{p}}$$

- U<sub>C</sub> - Capacitor voltage - rms value of required voltage of the capacitor. The reactor causes increase of the mains voltage at capacitor.
- P - Detuning factor - ratio of reactor inductance and capacitor capacitance reactances.
- f<sub>r</sub> - Series resonance frequency - between reactor and capacitor.
- U<sub>N</sub> - Nominal (rated) mains voltage
- f<sub>N</sub> - Nominal (rated) mains frequency

# LOW VOLTAGE POWER CAPACITORS

## Basic parameters

- Voltage 230 – 1000 V
- Output up to 50 kvar
- Self-healing dry design
- Three phase – Delta connection
- Single phase on request
- Overpressure disconnecter
- Built-in discharge resistors
- Other voltages and power on request

## Options

- IP 54 protection covers for selected types
- Mounting clamps

## Application

Power capacitors are intended for individual, group or central power factor correction to compensate inductive reactive power of industrial appliances such as electric motors, welding equipments, etc. This inductive power is undesirable for the grid provider and shall be avoided with power factor compensation.

## Construction

Power capacitors are produced in MKP system. It means metallized polypropylene with self-healing properties and extremely low dielectric losses. Capacitors are filled either with inert gas (N<sub>2</sub>) or semi solid resin for 50kvar. The resin is non-toxic and environmentally friendly. Three phase capacitors have three elements connected in delta. Capacitors are protected with overpressure disconnecter, which ensures safe disconnection of the capacitor from the network in the event of overloading or at the end of its operation life. All the capacitors are equipped with built-in discharge resistors.

**The case of the capacitor is protected against bursting by the overpressure disconnecter. Its proper function is ensured only if the specifications and conditions (voltage, current, temperature, correct installation, maintenance) are observed. Failure to meet and/or exceed these conditions may result in bursting of the capacitor case or even explosion and subsequent fire.**

## Installation instructions

Before installation it is necessary to make sure whether the nominal data of the capacitors correspond with the data indicated in the project and in the purchase order.

For cable connection of terminals or bolts and earthing bolts the following torques must be respected (unless different values for individual parts of the equipment are specified):

- M5 - terminal screw 2 Nm
- M7 - terminal screw 5 Nm
- M12 Al - earthing bolt 5 Nm

Recommended distance between capacitors situated in the capacitor bank is 20 mm at least.

It is recommended to check all the electric connections after a few days of operation and to make a visual inspection of all capacitors.

Before the switch on of the equipment check the connection and function of protection devices in the absence of voltage.

The fuses must be designed for capacitors, characteristic gG. The nominal voltage of the fuses must comply at least with the next higher normative voltage of the net, and the fuses must withstand current 1,6 times higher of the max. current on the capacitor.

## Product application guide

Series	Specification	THD-U	Lifetime expectancy	Temp. category
<b>N</b>	For standard operating conditions	≤ 2 %	> 130 000	-40 / D
<b>HD</b>	For general use in high level applications	≤ 3 %	> 150 000	-40 / D (60°C)
<b>UHD</b>	For applications with more demanding operating conditions	≤ 4 %	> 180 000	-40 / D (60°C)

## Recommended solution for detuned systems with higher harmonic content

Specification	Damping coef.	THD-U
Detuned system with filter reactors	p = 7 %	3,5 - 7 %
Detuned system with filter reactors	p = 14 %	≥ 7 %

## Permitted overvoltages

RMS overvoltage	Max. period
1,10 x U <sub>N</sub>	8 hours/day
1,15 x U <sub>N</sub>	30 min/day
1,20 x U <sub>N</sub>	5 min (200x)
1,30 x U <sub>N</sub>	1 min (200x)

## Temperature category

Temperature category	Ambient temperature		
	Max.	24 hours*	1 year*
C	50 °C	40 °C	30 °C
D	55 °C	45 °C	35 °C
D (60 °C)	60 °C	45 °C	35 °C

\* Max. mean value during period

## N - Normal

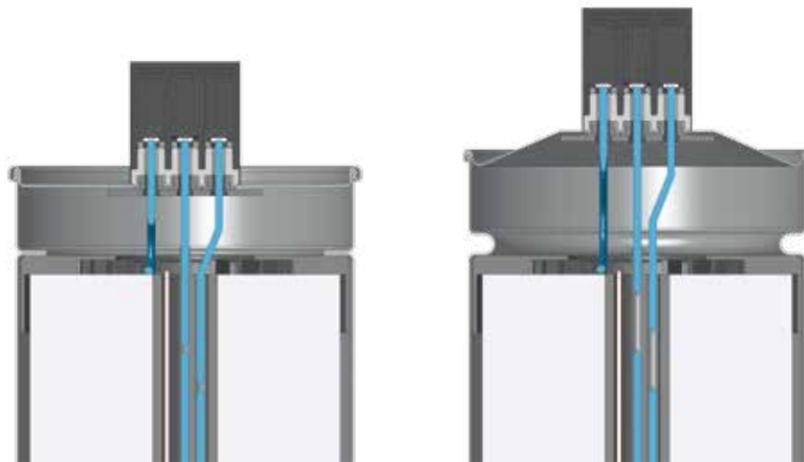

Three phase power capacitors, selfhealing, dry - gas filled.

### General technical parameters

Standards	IEC EN 60831-1/2, VDE 0560-46/47, GOST 1282-88
Rated voltage	400 - 525 V / 50 Hz
Rated power	1 - 50 kvar
Capacitance tolerance	-5 / +10 %
Max. permissible current	1,5 x I <sub>N</sub> continuous
Max. inrush current	300 x I <sub>N</sub>
Capacitor losses	cca 0,4 W / kvar
Discharge resistors	built-in 50 V / 1 min (75 V / 3 min over 30 kvar)
Statistical life expectancy	> 130 000 hours according to operating conditions
Protection degree	IP 20 (IP 54 selected types on request)
Max. relative humidity	95 %
Cooling	Natural air or forced
Max. altitude	4 000 m
Mounting position	Any position
Case	Aluminium can
Dielectric system	Dry metallized polypropylene
Impregnant / Filling	Inert gas N <sub>2</sub> or semi-dry resin (50kvar)
Safety device	Overpressure disconnecter
Terminals	Two side - 6 clamps

### Overpressure disconnecter function

## N - Normal

Three phase power capacitors, selfhealing, dry - gas filled.

### N Features

$I_{max} = 1,5 \times I_N$   
Lifetime expectancy: > 130 000 h  
Temperature class: -40/D  
Dry type: gas filling

### Drawing

# LOW VOLTAGE POWER CAPACITORS

## UHD - Ultra Heavy Duty

Three phase power capacitors, selfhealing, semi-dry resin.

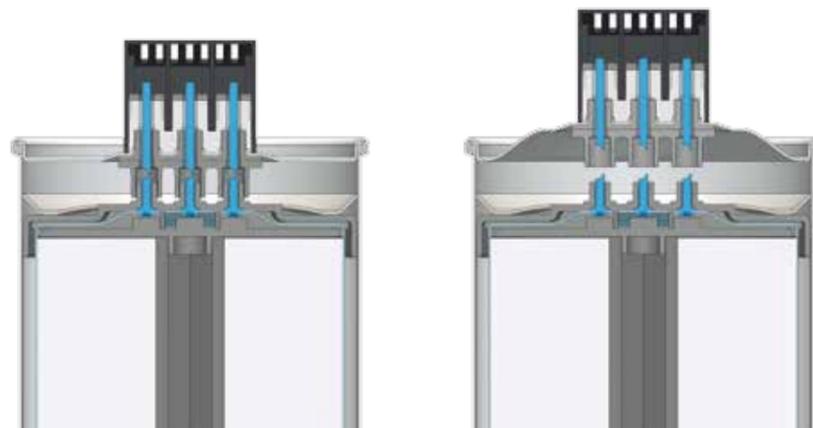

### General technical parameters

Standards	IEC EN 60831-1/2, VDE 0560-46/47, GOST 1282-88
Rated voltage	440 V, 525 V / 50 Hz
Rated power	1 - 50 kvar
Capacitance tolerance	-5 / +10 %
Max. permissible current	1,5 x I <sub>N</sub> continuous, 2,5 x I <sub>N</sub> short period *
Max. inrush current	400 x I <sub>N</sub>
Capacitor losses	cca 0,4 W / kvar
Discharge resistors	built-in 75 V / 3 min
Statistical life expectancy	> 180 000 hours according to operating conditions
Protection degree	IP 20 (IP 54 selected types on request)
Max. relative humidity	95 %
Cooling	Natural air or forced
Max. altitude	4 000 m
Mounting position	Any position
Case	Aluminium can
Dielectric system	Dry metallized polypropylene
Impregnant / Filling	Semi-dry resin
Safety device	3 fuses overpressure disconnecter
Terminals	One side - 3 clamps

Note: \*Maximum current for 48 hours continuous operation with relation to highest mean ambient temperature of 45 °C over period of 24 h.

### Three phase overpressure disconnecter function

## UHD - Ultra Heavy Duty

Three phase power capacitors, selfhealing, semi-dry resin.

### Standard types

(other voltages, power and 60 Hz on request)

## 440 V / 50 Hz

# LOW VOLTAGE DETUNING REACTORS

## Application

Frequent use of power electronic devices with nonlinear loads leads to harmonic distortion in electrical system. This nonsinusoidal load causes increase of effective current of power capacitor and other components of the system as well as the possibility of capacitor resonance with other inductive loads. Finally it may lead to problems or even failures in the installation. The solution is to use detuning (filtering) reactors, which creates a series resonant circuit with power capacitors. This detuned system prevents the installation from resonance effect and also acts as a filter for higher harmonic content. Usually there is recommended to use detuning reactors for the total voltage distortion THD-U higher than 3%.

## Construction

Detuning reactors are produced from high grade, low loss transformer sheets, with winding either from copper wire or aluminium band. Iron core is designed with multi air gap to meet high current linearity and low thermal losses. They are impregnated with high quality epoxy resin to ensure good insulation, low noise and long lifetime. Reactors are equipped with thermal protection to prevent overheating. Reactors with lower rated power are designed with copper wire and outlets via terminal block or cable lug. Higher power rated reactors are produced from aluminium band with outlets as aluminium bars (copper outlets are possible on request).

## General technical parameters

Standards	IEC EN 60076-6, IEC EN 61558-2-20
Rated voltage	400 - 800 V / 50 Hz
Rated power	1 - 100 kvar
Inductance tolerance	-5 / +5 %
Detuning factor	5,67 %, 7 %, 14 %
Resonance frequency	210 Hz, 189 Hz, 134 Hz
Temperature class	F (155 °C)
Ambient temperature	40 °C
Statistical life expectancy	> 200 000 hours
Protection degree	IP 00
Insulation (winding - core)	3 kV
Max. relative humidity	95 %
Max. altitude	4 000 m
Cooling	Natural air or forced
Design	Three phase, iron core with multi air gap
Winding material	Copper (TKC), aluminium (TKA)
Impregnant	Polyester (epoxy) resin
Safety device	Thermal switch (TKA-130 °C, TKC-90 °C)
Terminals	Terminal block, cable lug, Al bar

## Reactor power designation

Reactor type designation is always according to power of matching capacitor  $Q_C$

$Q_C$  - Rated power of the capacitor

$Q_{LC}$  - Rated power of the detuned system (capacitor + reactor)

## Example

Power		Capacitance	Type	Inductance	Current	Weight	Dimensions
$Q_C$ (kvar)	$Q_{LC}$ (kvar)	$C_N$ ( $\Delta$ ) ( $\mu$ F)		$L_N$ (mH)	$I_N$ (A)	m (kg)	WxDxH (mm)
$U_N = 400 \text{ V}$ $U_C = 440 \text{ V}$ $p = 7 \% (189\text{Hz})$ $I_{lin} \geq 1,6 I_N$							
50	44,4	274	TKA1-50-189/400/440	0,86	64,1	23	250 x 185 x 215

# PFC CONTROLLERS

## PFC controller MULTI PFR 6/12

The new generation of the MULTI PFR reactive energy controller has been developed to meet the most demanding reactive power regulation requirements.

The MULTI PFR controller provides possibility of using three or one current transformers, integrated network analyzer and residual current control in the installation. Combined with the ability to program alarm states, the MULTI PFR is a great tool for regulation and preventative maintenance too. This ensures maximum control and security of installation.

### Characteristics

- unit for regulation of 6 and 12 steps
- integrated power analyzer and controlling residual leakage currents
- RS-485 communication interface with Modbus RTU protocol
- alarms – for example temperature (fan relay), operating states, indicates the risk of the presence of harmonics etc.

### Technical features

		MULTI PFR 6/12
Voltage circuit	Power supply voltage	100 - 520 V AC
	Tolerance	10 %
	Frequency	50 / 60 Hz
Measurement circuit	Measurement voltage	35 - 520 V AC Ph-Ph 20 - 3000 V AC Ph-N
	Current transformers	1x or 3x pcs / 5 or / 1 A
Leakage current	Measurement range	$I_{\Delta prim} = 10 \text{ mA} - 1,5 \text{ A AC}$
Accuracy	Voltage and current	0,5% ± 1 digit
	Active power measurement	0,5 % ± 2 digit
Output relays	No. of relays	depending on type
	No. of relays	2
Digital outputs	Type	NPN transistor
	$U_{max} / I_{max}$	24 V DC / 50 mA
Digital inputs	No. of inputs	2
Alarms	No. of alarms	17
Communications	Port	RS-485
	Protocol	Modbus / RTU
Safety	Insulation	Category III Class II
	Protection degree	IP31 IP51 (front panel)

## PFC CONTROLLER PFR6 / PFR12

PFR6/PFR12 is the type of power factor regulator designed for easy and effective regulation. Regulator monitors the power system status and accurately and quickly takes decisions on the connection or disconnection of compensation stages in order to reach the preset target cos phi.

## PFC CONTROLLER Super PFR 6/12

SUPER PFR6/PFR12 controller brings some new features to the previous version PFR 6/12. These include the measurement of current and voltage harmonic distortion, temperature measurement, RS-485 interface or automatic setup mode.

Regulator monitors the power system status and accurately and quickly takes decisions on the connection or disconnection of compensation stages in order to reach the preset target cos phi.

### Technical features

	PFR6 / PFR12	Super PFR6 / PFR12
Measurement	THD	THDI and THDU
Temperature measurement	no	yes
Alarm output	yes	yes
FCP system	yes	yes
Interface	no	RS-485
4 quadrant PFC	yes	yes
Supply and measuring voltage	400 V AC (+15%/-10%), 50 / 60 Hz	400 V AC (+15%/-10%), 50 / 60 Hz
Current measurement circuit	CT, IN / 5	CT, IN / 5
Accuracy of voltage measurement	1 %	1 %
Accuracy of current measurement	1 %	1 %
Accuracy of cos φ measurement	±2%	±2%
Display	1 line, 3 digits, 7 segments, 20 icons	4 lines, 15 digits, 55 icons
Output	relays, max. 250 V, 10 A, AC1	relays, max. 250 V, 4 A
Protection degree	IP 51	IP 40
Dimensions	144 x 144 x 62 mm	144 x 144 x 62 mm
Connection	12 - steps regulator	12 - steps regulator

# CAPACITOR SWITCHING CONTACTORS

## Capacitor switching contactors CC

CC Capacitor Contactors are suitable for switching low-inductive and low-loss capacitors in capacitor banks, without and with reactors.

CC Capacitor Contactors are designed to meet Capacitor Duty application. Contactors are fitted with block of three early make auxiliary contacts in series with six quick discharge damping resistors – 2 per phase. These auxiliary contacts limit peak current in first stage of switching. Subsequently the nominal current is transferred through main contacts which are switched in next stage and the auxiliary contacts are switched-off at the same time.

### The main features

- electrical life
- reduced watt loss during 'ON' condition, saves energy
- switching of Capacitor bank in parallel without de-rating

### Technical features

Complete contactor block (contactor + resistors)	Power (kvar)			Rated current (A) at 400 V/50 Hz	Frequency of switching (per hour)	Electrical endurance (switching)	Auxiliary contacts	Dimensions W x D x H (mm) including damping resistors

## Capacitor switching contactors K3

Contactors K3...K are suitable for switching low-inductive and low loss capacitors in capacitor banks (IEC 70 and 831, VDE 0560) without and with reactors.

Capacitor switching contactors are fitted with early make contacts and damping resistors, to reduce the value of make current < 70 x Ie.

### Operating conditions

Capacitor switching contactors are protected against contact welding for a prospective making current of 200 x rated current. Fuse rating approx. 1,6 to 2,5 x rated current, type gL (gG).

acc. to IEC 947-4-1, IEC 947-5-1, EN 60947-4-1, EN 60947-5-1, VDE 0660

### Technical features

Type	Power (kvar)			Rated current (A)	Frequency of switching (per hour)	Electrical endurance (switching)	Auxiliary contacts	Dimensions W x D x H (mm) including damping resistors

# MEDIUM VOLTAGE POWER CAPACITORS

## Application

### Power factor correction

### Filtering of harmonics

### Ripple control coupling capacitors

### Surge capacitors for generators and transformers

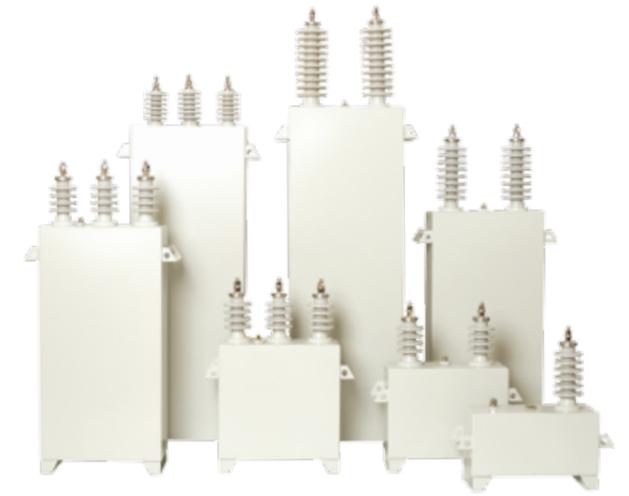

### Low frequency induction heating

## Basic characteristics

- Output up to 1000 kvar
- For outdoor/indoor installation
- Without or with internal fuses for higher reliability
- Surface treatment against corrosion
- 100% routine tests
- Voltage and output rating as required by customer
- Single phase capacitors with two or three outputs

## Construction

MV capacitors are manufactured with all-film technology. The dielectric is polypropylene foil impregnated with synthetic liquid known under the trade name JARYLEC, which is harmless to health and environmentally friendly. Electrodes are of aluminum foil. This construction ensures extremely low losses of capacitors.

Internal interconnection is in the case of three-phase units to the star and is marked with „Y“, for single-phase it is „I“. The units have built-in internal discharge resistors reducing the voltage to 75V within 10 minutes. The three-phase and single-phase units are in fully insulated containers.

## Options

- Internal fuses
- Faster discharge resistors (50V/5min)
- Overpressure sensor
- Live case
- M16 terminals

## Installation instructions

- The bushings must not be mechanically stressed
- Keep a minimum distance of 60mm between capacitors
- Device must be discharged before manipulation with capacitors and the terminals must be short-circuited
- Max. torque for clamping bolt of insulators M12 is 20/25Nm
- Check all electric connections and visually check the tightness of the capacitors after several days of operation

# MEDIUM VOLTAGE POWER CAPACITORS

## General technical parameters

Standards	IEC 60871-1, EN 60871-1, GOST 1282-88
Rated voltage	1 - phase: 1 - 24 kV 3 - phase: 1 - 15 kV
Rated power	25 - 1000 kvar
Rated frequency	50 / 60 Hz
Capacitance tolerance	-5 / +10 %
Test voltage terminal - terminal	2 x U <sub>N</sub> AC / 10 s or 4 x U <sub>N</sub> DC / 10 s
Test voltage terminal - case	according to the insulation level / 10 s
Max. permissible current	1,5 x I <sub>N</sub>
Inrush current	300 x I <sub>N</sub>
Capacitor losses	cca 0,2 W / kvar (dielectric 0,06 W / kvar)
Discharge resistors	built-in 75 V / 10 min
Statistical life expectancy	> 150 000 hours under standard conditions
Protection degree	IP 00
Temperature category	-25 / C - other on request
Max. relative humidity	95 %
Cooling	Natural air
Max. altitude	4 000 m
Mounting position	Vertical or horizontal (narrow side)
Case	Stainless - steel
Dielectric system	all - film
Impregnant	Jarylec (environmentally - friendly, non - toxic, non - PCB)

## Approximate dimensions and weight

### 1-phase capacitors, voltage up to 13,86 kV, no fuses

Output at 50 Hz (kvar)	Output at 60 Hz (kvar)	Weight (kg)	Case dimensions L x W x H (mm)
50	60	18	350 x 145 x 180
100	420	19	350 x 145 x 250
150	180	27	350 x 145 x 330
200	240	33	350 x 145 x 420
250	300	37	350 x 145 x 480
300	360	41	350 x 145 x 550
350	420	44	350 x 175 x 500
400	480	49	350 x 175 x 570

750	900	78	350 x 200 x 870
800	960	81	350 x 200 x 910
1000	1200	100	350 x 200 x 1130

## Internal fuses

The function of internal fuses is isolating a faulty element from the others to allow proper function of the capacitor unit.

The internal fuses in capacitor are restricted with the energy contained in the each internal section. This energy is very important for secure disconnection of the fuse in the case of fault inside any element. For their proper function there is important that capacitor has sufficient energy for save disconnection of the fuse. On the other hand the fuses must not disconnect during switching (on and off) of the unit.

Both types of capacitors (internally fused or not) would be equipped with correctly selected external fuses.

## Single phase units (CUEFS & CUFFS)

## CPEFS – three phase type, up to 15kV

## CUEFS – single phase type, insulated case

## CUFFS – single phase type, live case

# MV DETUNING REACTORS

Standard design is intended for detuned capacitor banks. Reactors have high linearity, low losses and minimal noise. Inductance is fixed to the exact value with tolerance of  $-1/+3\%$ . Reactors are designed for capacitors at 7200 V (grid 6000 V) and 12000 V (grid 10000 V), 50 Hz and tuned to resonance frequency of 189 Hz. Reactors are wound on Fe core with insulation class „B“.

## Function of reactors

- Limiting inrush current during switching of capacitors.
- Limiting resonance and protection of capacitor banks against over loading arising from higher harmonics.
- Avoiding loss of power frequency (power remote control) from general power company.
- Getting power resonance circuits tuned to higher harmonic frequencies.

### 7 200 V, 189 Hz (7%)

Type	Capacitor power $Q_N$ (kvar)	Inductance $L_N$ (mH)	Current $I_N$ (A)	Dimensions W x D x H (mm)	Weight (kg)

Other specifications (voltage, power, frequency) are available on request.

## Drawing

VC contactors are specifically designed for industrial applications where large number of operations is required. Usual using is for switching the capacitors. This VC vacuum contactor is optimal for capacitor banks from 3,3 up to 6,6 kV.

### Technical features

- vacuum, extinguishing method
- perfect control of the electrical arc in capacitive operations
- very long life expectancy
- fully insulated equipment made up of three independent vacuum poles in an insulated structure
- small size
- optimized weight
- easy maintenance

### Technical data

Electrical data	
Auxiliary voltage	220 V AC standard, 110 V AC or DC on request
Rated voltage	6,6 kV
Rated current	400 A
Breaking capacity	4 kA
Frequency	50 / 60 Hz
Insulation voltage	7,2 kV
Category	AC 3
No. of operations	300 000
Max. operating power	2 000 kvar at 6,6 kV
Assembly features	
Connections	fixed
Dimensions	385 x 398 x 247 mm
Weight	24 kg
Standards	IEC 62271

These instruments current and voltage transformers are intended for measuring and protection of high voltage distribution systems of the indoor as well as outdoor type. These instruments transformers are intended for the voltage system from 3,6kV up to 40,5kV. The transformers comply with requirements of IEC 60044-1, IEC 60044-2, GOST 1983-89 and DIN 42600/1983.

### Current transformers

Type	Voltage (kV)	Primary current (A)	Secondary current (A)	Power (VA)	Weight (kg)	Outdoor / indoor

Automatic capacitor banks type QR are used for the power factor correction of inductive character loads in low voltage power networks. Substation switchgears are used in different application as: distribution, control, supply, motor, lightning, measuring switchgears.

Capacitor banks are designed in steel-plate cabinets (vertical construction mounted type by smaller power ranges). The banks are equipped with automatic PFC regulator, switching contactors, cylindrical capacitors ZEZ SILKO (MKP capacitors, dry type), fuses. Main switch is installed in all banks (three-phase circuit breaker or fuse switch).

See catalogue „CAPACITOR BANKS, SWITCHBOARDS“.

### Standard power ranges

Type	Power	
QRC	5,45 - 34,4 kvar	wall-mounted
QRN	21,9 - 87,5 kvar	wall-mounted
QRS	93,75 - 150 kvar	wall-mounted
QRV	100 - 500 kvar	standard
QRG	425 - 1200 kvar	standard
QRF	68,75 - 1000 kvar	detuned
QRFR	50 - 800 kvar	fast-switched
QRH	up to 4000 A	substation

Capacitor banks type SCA, SCB and ACB are used for individual or central power factor correction in medium voltage power networks.

Capacitor banks are designed in steel-plate cabinets (SCB, ACB) or on steel frames (SCA) according to requirements of the customer specifications.

Standard construction of the bank includes ZEZ SILKO MV capacitors (three-phase units or single-phase units in star connection, alternatively single-phase units in double-star connection), set of three fuse-bases with fuses. According to the requirement it is possible to include also inrush current reactors or other protection and measuring elements (unbalance relay, detuning reactor, current transformer,...).

See catalogue „CAPACITOR BANKS, SWITCHBOARDS“.
