

BUCKETMASTER

Automated Bucket Wheel Controller

Maintain Precise Wheel Speed To Maximize Production

The **BUCKETMASTER** by **Cornerstone Industries** automatically controls the speed of the bucket wheel based on the amount of material entering the bucket wheel tub. The **BUCKETMASTER** has up to 10 speed settings that allow the wheel to move from a crawl to full rated speed. As variable rates of material enters into the wheel tub, the **BUCKETMASTER** shifts to the optimum speed range to maximize production, but yet dewater the material to minimize the amount of water content in the material exiting the wheel.

The **BUCKETMASTER** will automatically detect a stalled out wheel condition and will automatically turn the wheel in reverse just enough to dislodge the material causing the stall condition. Once the material has been dislodged the wheel begins turning in a forward motion and seeks the correct speed to again maximize the wheel performance.

No other wheel controller on the market can deliver such a smooth and precise speed control as the **BUCKETMASTER**.

Call **Cornerstone Industries** today for more information.
