Post-Storm Tree Care: Protecting What Weather Left Behind

The recent storms may be over, but for your trees, the recovery process has only just begun. Whether they stood tall or took a hit, your trees could be under stress — and that stress can invite unwanted guests.

Give Your Trees a Boost This Fall

Help your trees bounce back with deep root fertilization — a fall treatment that supports healing and builds resilience. Healthy, well-fed trees are less likely to fall victim to pests and future weather events.

Ed's Vital Tips for Ongoing Tree Health:

- ✓ Continue deep, consistent watering, especially during dry weeks
- ✓ Don't panic — not all storm-exposed trees need removal
- ✓ Stay ready: Hurricane prep should remain on your radar

Insect Activity is on the Rise

Storm-stressed trees emit chemical signals (yes, really!) that attract boring insects, like the pinewood beetle. These insects are nature's cleanup crew in wild forests, but in your yard, they can turn a healthy-looking tree into a hidden hazard.

If your trees were damaged, they may be silently under attack. The good news? We offer injection treatments that protect vulnerable trees for 1-2 years, giving them the strength they need to recover.
