HELPING YOUR TREES THRIVE THROUGH STORM SEASON

Your Trees Are Low-Stress – For Now

Thanks to recent rains, your trees are thriving – and that's your cue to act. This is the ideal time to prune, fertilize lightly, and prep for hurricane season.

Use this energy-saving moment to boost resilience and prevent storm damage before the heat and wind hit hard.

What Your Trees Need Right Now

- ✓ Hazard reduction pruning (fewer breakable limbs in storms)
- ✓ Light fertilization (not too much!)
- ✓ Insect treatment (pine beetles, scale, whiteflies)
- ✓ Tree health inspection by an ISA-certified arborist

Hurricane Season is Here

Prepare Now, Worry Less Later.

Pruned, healthy trees are far more likely to survive high winds and protect your property.

Pine Bark Beetle Alert

We're seeing a bit of pine and bark beetle action in the area. While there isn't a significant outbreak, it's essential to stay vigilant because these beetles can kill trees if not caught early.

TREE STRESS: WHAT TO WATCH FOR

Thinning Canopy

Loss of leaf coverage =
early stress sign

Dropping Leaves

Trees reduce "expenses"
to conserve energy

Too Much Fruit or Cones

Could be a survival strategy
– or a soil nutrient surge

Tip: Only a certified arborist
can tell the difference!
