

Update 6/20/24: Lake Treatment

Water testing of the main lake has been completed. This is our first sample of 2024. Results should be posted this weekend. Thor and Valhalla will be tested next week.

The main lake has been spot treated for weeds and algae where conditions warrant.

Friday 6/21/24, the main lake will be treated with the first of two treatments for algae with a product called VodaGuard C. Aqua Doc, our lakes professional treatment company, has advised the Association of the necessity of this treatment. The product has been properly vetted and is a good short-term solution for the LPOA (short term may be as long as 2-3 years).

VodaGuard is a water treatment technology that can be used to treat algae blooms in lakes and ponds, and cure infections in the upper water column. It comes in two forms:

VodaGuard C, which is a copper sulfate pentahydrate product, and VodaGuard O, which is a sodium percarbonate that turns into hydrogen peroxide when added to

VodaGuard C is an algaecide, bactericide, and fungicide that can be used to prevent or cure cyanobacteria outbreaks. It's effective against harmful cyanobacteria strains while minimizing the risk to fish and beneficial bacteria. Before applying VodaGuard C to municipal waters, you should consult your state's fish and game agency.
