

Attention CSC Daytona Installer or Owner

2014-2019 Harley-Davidson Daytona trike conversions require an external Bank Angle Sensor simulator to be installed during trike installation so that the trike does not turn off while going around a sharp corner. In order for your trike to recognize it, your H-D dealer must change the motorcycle ECM programming. This programming can be done at any time but is preferable that it be done before the motorcycle has the trike kit installed. Please make plans with your H-D dealer or installer to have this done.

This is a very simple job and takes only a few minutes.

The H-D dealer must connect the “Digital Technician” computer to your trike/bike.

1. Enter the “BCM Customization” menu
2. Go to “External B.A.S” (Bank Angle Sensor)
3. Choose “2014-2018 Triglides or Sidecar”. NOTE: Choose this option even if you have a 2019 bike.

That’s it.

Enjoy the Ride
