

Technology Policy & Regulation

This comprehensive report examines the unprecedented constitutional confrontation between Colorado and the Trump administration over the Colorado AI Act, America's first comprehensive state-level AI accountability law. With just five months until implementation, the federal government has deployed an aggressive multi-pronged strategy including litigation threats, withholding \$420.6 million in rural broadband funding, and establishing a dedicated DOJ task force to challenge state AI regulations. The report analyzes the complete legislative framework of Colorado's law, the constitutional and legal dimensions of federal preemption attempts, stakeholder positions across government and industry, economic impacts including compliance costs and funding leverage, and potential resolution pathways. Readers will gain deep insight into the fundamental tensions in American federalism over emerging technology governance, understand the specific requirements and implications of the Colorado AI Act, learn about the legal precedents and constitutional doctrines at play, and discover how this conflict will likely establish precedents affecting AI regulation nationwide. This matters because the outcome will determine not only how AI systems are regulated in America but also whether states retain meaningful authority to protect consumers from algorithmic discrimination and other AI-related harms in the absence of federal legislation.

THE TAKEAWAY

- #1** Colorado's AI Act, set to take effect June 30, 2026, establishes the nation's first comprehensive framework requiring developers and deployers of high-risk AI systems to prevent algorithmic discrimination in consequential decisions affecting employment, housing, healthcare, lending, education, and insurance.
- #2** The Trump administration has launched an unprecedented federal campaign to block the law through Executive Order 14,179, establishing a DOJ AI Litigation Task Force, threatening to withhold \$420.6 million in rural broadband funding, and calling for federal legislation to preempt state AI regulations entirely.
- #3** The constitutional conflict centers on fundamental federalism questions: the executive order cannot directly preempt state law

Colorado vs. Federal Government: The AI Regulation Showdown

without congressional action, but the administration is deploying litigation threats based on the dormant Commerce Clause and conditional spending doctrines to pressure Colorado into abandoning or weakening its law.

#4 Colorado officials, led by Attorney General Phil Weiser, have taken a defiant stance, declaring federal funding threats 'unlawful and unconstitutional' and promising to defend the law in court, while Governor Jared Polis has convened an AI Policy Working Group to explore potential compromise amendments.

#5 The technology industry opposes the law, arguing that state-by-state AI regulation creates an untenable compliance burden and that companies cannot train 50 different AI models to meet varying state requirements, threatening to relocate operations if the law proceeds unchanged.

#6 Consumer protection advocates support the law as essential accountability for AI systems that increasingly make life-altering decisions, noting that without regulation, algorithmic discrimination in employment, housing, and other critical domains will continue unchecked, with the unemployment rate for new entrants hitting 13.4% in 2025 partly due to AI displacement.

#7 The threatened loss of \$420.6 million in BEAD funding would devastate rural Colorado communities, affecting plans to connect approximately 96,000 Coloradans to high-speed internet, with counties like Garfield having invested years and millions in infrastructure that federal funding would complete.

#8 Legal experts express skepticism about the administration's authority to block state AI laws through executive action alone, noting that dormant Commerce Clause challenges face high bars after recent Supreme Court precedent, and that conditional spending threats may be unconstitutionally coercive given the magnitude of funding at stake.

#9 Potential resolution pathways include negotiated compromise through amendments focusing liability on large AI developers rather than employers, protracted litigation over constitutional authority that could take years to resolve, federal legislation establishing uniform national standards (though over 150 AI bills failed to pass in the previous Congress), or state defiance with multi-state coordination if other jurisdictions join Colorado in implementing similar laws.

#10 The conflict's outcome will establish critical precedents affecting not only AI regulation nationwide but also the broader question of state authority over emerging technologies, determining whether states can serve as 'laboratories of democracy' for technology governance or whether federal primacy will effectively centralize regulation even absent congressional legislation.

January 8, 2026 40 minute read Print

html

Colorado stands at the epicenter of an unprecedented constitutional confrontation over artificial intelligence regulation. With just five months remaining until the Colorado AI Act takes effect on June 30, 2026, the state faces mounting pressure from the Trump administration to abandon or substantially weaken what is widely recognized as the nation's first comprehensive AI accountability law. The federal government has deployed an aggressive multi-pronged strategy: establishing a Department of Justice litigation task force specifically tasked with challenging state AI laws, threatening to withhold \$420.6 million in rural broadband funding, and signaling plans for sweeping federal legislation that would preempt state-level AI regulation entirely.^{[9][6]}

The conflict crystallizes fundamental tensions in American federalism—the balance of power between state and federal governments—while raising critical questions about who should regulate one of the most transformative technologies of the 21st century. At stake are not merely abstract legal principles, but concrete impacts on Colorado communities, technology companies, and the future trajectory of AI governance

Colorado vs. Federal Government: The AI Regulation Showdown

nationwide. The Trump administration frames state AI regulation as an existential threat to American technological competitiveness, arguing that "United States AI companies must be free to innovate without cumbersome regulation" and that state-by-state requirements create an untenable "patchwork of 50 different regulatory regimes."^[8] Colorado officials, by contrast, view their law as essential consumer protection, with Attorney General Phil Weiser declaring that "attempts by the federal government to coerce policy change through intimidation and the illegal withholding of funds are unlawful and unconstitutional."^[12]

This standoff has attracted national attention as other states watch closely to determine whether Colorado's pioneering approach will survive federal opposition or be dismantled before implementation. The outcome will likely establish precedents affecting not only AI regulation but the broader question of how emerging technologies are governed in the American federal system.

The Colorado State Capitol, where lawmakers debate the future of AI regulation.

The Colorado AI Act: Legislative Framework and Requirements

KEY POINTS

Colorado's groundbreaking legislation establishes the first comprehensive state-level framework for regulating high-risk AI systems, focusing on preventing algorithmic discrimination while imposing extensive documentation and transparency obligations on developers and deployers.

Core Provisions and Scope

Colorado's capitol, where the AI Act was signed into law in May 2024.

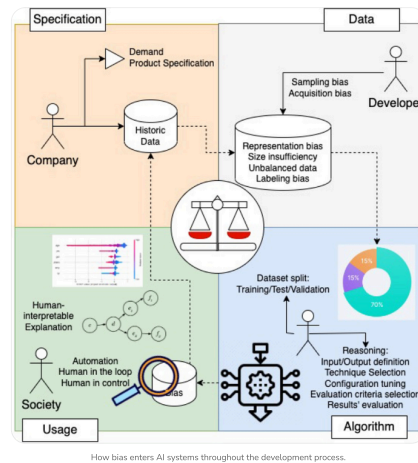

The Colorado Artificial Intelligence Act (Senate Bill 24-205), signed into law on May 17, 2024, by Governor Jared Polis, represents a landmark attempt to regulate AI systems that make "consequential decisions" affecting Colorado residents.^[6] The law specifically targets AI applications used in critical domains including "employment, housing, healthcare, lending, education, and insurance decisions."^[6] As the Center for Democracy & Technology explains, "AI

decision systems play a growing role in deciding whether you get a job, an apartment, a mortgage, or health care, as well as how much you earn and how much you pay for a product or service."^[15]

The Act's central requirement mandates that "a developer of a high-risk artificial intelligence system shall use reasonable care to protect consumers from any known or reasonably foreseeable risks of algorithmic discrimination."^[13] This "reasonable care" standard creates a rebuttable presumption of compliance if developers and deployers follow specific guidelines and risk management frameworks.^[14] The law defines algorithmic discrimination broadly as "any condition in which an artificial intelligence system materially increases the risk of an unlawful differential treatment or impact that disfavors an individual or group of individuals on the basis of their actual or perceived age, color, disability, ethnicity, genetic information, limited proficiency in the English language, national origin, race, religion, reproductive health, sex, veteran status, or other classification protected under the laws of this state."^[13]

Documentation and Transparency Mandates

The Colorado AI Act imposes what critics describe as a "headache-inducing laundry list of documentation and record-keeping requirements on developers and deployers."^[1] Developers must "make available, in a manner that is clear and readily available for public inspection, a statement summarizing the types of high-risk artificial intelligence systems that the developer has developed or intentionally and substantially modified and currently makes available to a deployer."^[13] This public disclosure requirement extends to known or foreseeable risks of algorithmic discrimination, which must be disclosed within 90 days of discovery.^[14]

Additionally, the law requires that "a person doing business in this state, including a deployer or other developer, that deploys or makes available an artificial intelligence system that is intended to interact with consumers must ensure disclosure to each consumer who interacts with the artificial intelligence system that the consumer is interacting with an artificial intelligence system."^[14] For AI systems generating synthetic digital content, developers must "ensure that the outputs of the artificial intelligence system are marked in a machine-readable format, detectable as synthetic digital content, and marked in a manner that is clear to consumers."^[13]

"The law does not require companies to disclose source code, training data, or intellectual property."

Importantly, as the Center for Democracy & Technology emphasizes, "The law does not require companies to disclose source code, training data, or intellectual property."^[15] This distinction addresses some industry concerns about protecting trade secrets while still mandating transparency about system purposes, risks, and decision-making processes.

Impact Assessments and Risk Management

Companies deploying high-risk AI systems must conduct annual impact assessments analyzing potential risks of algorithmic discrimination.^[15] These assessments represent a proactive approach to identifying and mitigating bias before harm occurs. The law provides an affirmative defense for entities that comply with "a nationally or internationally recognized risk management framework for artificial intelligence systems" and take specified measures to discover and correct violations.^[14] The legislation specifically references frameworks like ISO 42001 and the NIST AI Risk Management Framework as recognized models for responsible AI governance.^[16]

Enforcement Mechanism and Cure Period

Attorney General Phil Weiser has exclusive authority to enforce the AI Act.

The Colorado AI Act grants "the attorney general rule-making authority to implement, and exclusive authority to enforce, the requirements of the act."^[14] Notably, the law does not create a private right of action, meaning only the Attorney General and district attorneys can bring enforcement actions.^[13] Violations are treated as deceptive trade practices under the Colorado Consumer Protection Act, with potential civil penalties up to \$20,000 per violation.^[16]

Colorado vs. Federal Government: The AI Regulation Showdown

A unique feature of the enforcement framework is the 60-day cure period established for the law's first year. "During the period from July 1, 2025, through June 30, 2026, the Attorney General or a District Attorney, prior to initiating any action for a violation, shall issue a notice of violation to the developer or deployer if the opportunity to cure is warranted."^[13] This grace period reflects legislative recognition of the challenges companies face in achieving compliance with novel requirements.

Implementation Timeline and Recent Modifications

Originally scheduled to take effect on February 1, 2026, the law's implementation was delayed to June 30, 2026, following a special legislative session in August 2025.^[5] This postponement occurred after "tech lobbyists pushed for changes" and lawmakers sought "more time to find common ground on how to regulate the industry without stifling businesses in the state."^[5] The delay also provided space for ongoing negotiations through a governor-appointed AI Policy Working Group, which includes representatives from the Colorado Technology Association, tech companies, and consumer groups.^[24]

Despite this delay and ongoing discussions about potential amendments, the core structure of the law remains intact. Representative Brianna Titone, a co-sponsor of the original bill, is working on a "repeal and replace" bill that would "simplify the process of addressing inaccurate AI data by putting the liability on developers of large-scale systems, like Google and Open AI, and not the smaller companies deploying them."^[6] However, as of January 2026, no consensus has emerged on substantive changes, leaving the June 30 implementation date as the operative deadline.

Federal Response: Executive Orders and Litigation Strategy

KEY POINTS

The Trump administration has launched an unprecedented executive branch campaign to block state AI regulations through litigation threats, funding leverage, and administrative pressure, despite lacking direct constitutional authority to preempt state laws.

The December 11 Executive Order

On December 11, 2025, President Trump signed Executive Order 14,179, titled "Ensuring a National Policy Framework for Artificial Intelligence," which "signals a significant escalation in efforts to establish federal primacy over state-level AI regulation in the United States."^[10] The order explicitly identifies Colorado's law as problematic, stating that "a new Colorado law banning 'algorithmic discrimination' may even force AI models to produce false results in order to avoid a 'differential treatment or impact' on protected groups."^[9] This characterization reflects the administration's view that anti-discrimination requirements could compel what it describes as "ideological bias" in AI systems.^[10]

President Trump signs the executive order targeting state AI laws.

The executive order articulates a clear policy position: "It is the policy of the United States to sustain and enhance the United States' global AI dominance through a minimally burdensome national policy framework for AI."^[3] The administration argues that "State-by-State regulation by definition creates a patchwork of 50 different regulatory regimes that makes compliance more challenging, particularly for start-ups."^[9] This framing positions state AI regulation as an impediment to American competitiveness against China in the global AI race.

The AI Litigation Task Force

Section 3 of the executive order "directs the Attorney General to establish an AI Litigation Task Force within 30 days."^[10] According to the order, the task force's "sole responsibility shall be to challenge State AI laws inconsistent with the policy set forth in section 2 of this order."^[9] The task force can bring challenges on multiple grounds, including that state laws "unconstitutionally regulate interstate commerce, are preempted by existing Federal regulations, or are otherwise unlawful in the Attorney General's judgment."^[3]

"An executive order is not a congressionally enacted

As legal analysts at AI Certs note, "Within Section 3, the Attorney General must stand up the Federal Taskforce by 10 January 2026."^[11] This compressed timeline—just 30 days from the

Colorado vs. Federal Government: The AI Regulation Showdown

statute or 'law.'" executive order's signing—underscores the administration's urgency in confronting state AI regulations. The task force represents an unusual deployment of federal litigation authority, with a dedicated team focused exclusively on challenging state technology laws.

However, as multiple legal experts emphasize, the executive order's power is limited. "An executive order is not a congressionally enacted statute or 'law.' While Congress undoubtedly has the authority to preempt some state AI laws by passing legislation, the President generally cannot unilaterally preempt state laws by presidential fiat (nor does the EO purport to do so)."^[1] Instead, "what an executive order can do is to publicly announce the policy goals of the executive branch of the federal government, and announce directives from the President to executive branch officials and agencies."^[1]

Funding Leverage: The BEAD Program Threat

Perhaps the most immediately impactful element of the federal strategy involves threatening Colorado's access to rural broadband funding. Section 5 of the executive order "introduces a mechanism for leveraging federal funding to discourage state AI regulation."^[10] Specifically, "Subsection (a) indicates that Commerce will attempt to withhold non-deployment Broadband Equity Access and Deployment (BEAD) funding 'to the maximum extent allowed by federal law' from states with AI laws listed pursuant to § 4 of the EO."^[1]

The BEAD program, established through the 2021 Bipartisan Infrastructure Law, represents "the largest broadband investment in American history."^[27] Colorado was originally allocated \$826 million under the program, though this was subsequently reduced to \$420.6 million following Trump administration policy changes in June 2025.^{[29][27]} The remaining \$420.6 million is now at risk if Colorado proceeds with its AI law.

Rural broadband expansion depends on federal BEAD funding.

This funding is critical for rural Colorado communities. As Senators Hickenlooper and Bennet noted in a December 2025 statement, "In Colorado, 10 percent of locations are unserved or underserved, and 190,850 households lack access to the internet."^[27] The BEAD funds are "expected to connect approximately 96,000 Coloradans to high-speed internet."^[27] The potential loss of this funding creates a stark choice for Colorado policymakers: maintain the AI law and sacrifice rural internet expansion, or abandon consumer protection measures to secure federal dollars.

Legal experts question whether this funding threat is constitutionally permissible. As the AI Certs analysis notes, "The Supreme Court has historically limited federal power to attach new conditions to already-accepted funds."^[11] The conditional spending doctrine, established in cases like South Dakota v. Dole, requires that funding conditions be clearly stated, related to the federal interest, and not so coercive as to constitute compulsion rather than genuine choice. Whether linking broadband funding to AI regulation meets these standards remains an open legal question.

Multi-Agency Coordination

The executive order directs multiple federal agencies beyond DOJ to coordinate responses to state AI regulations. "The December 11 EO spans 17 sections and asserts a national interest in unified AI policy. It directs the Justice Department, Commerce, FTC, and FCC to coordinate responses to restrictive state measures."^[11] This whole-of-government approach amplifies federal pressure on states, with each agency bringing distinct authorities and enforcement mechanisms.

The Commerce Department, for instance, must "publish a state law evaluation by 11 March 2026."^[11] This evaluation will identify which state AI laws the administration considers

Colorado vs. Federal Government: The AI Regulation Showdown

"onerous" and inconsistent with federal policy, potentially subjecting those states to funding restrictions or other consequences. The FTC is directed to provide guidance on unfair and deceptive practices related to AI, potentially creating federal standards that could conflict with state requirements.^[37]

Legislative Recommendations

Beyond immediate executive action, the order calls for longer-term legislative solutions. Section 6 directs relevant officials to "provide legislative recommendations to the Congress to establish a uniform Federal AI policy framework that would pre-empt conflicting State laws."^[18] This signals the administration's ultimate goal: congressional legislation that would formally preempt state AI regulations, providing the legal authority that an executive order alone cannot achieve.

However, federal AI legislation has proven elusive. "In the 118th Congress, more than 150 bills on artificial intelligence regulation were introduced, according to the Brennan Center for

Justice. Not one passed."^[12] As of January 2026, over 120 AI bills have been introduced in the current Congress, "all still pending."^[12] This legislative gridlock partly explains the administration's reliance on executive action and litigation threats—absent congressional action, the executive branch has limited tools to directly preempt state laws.

Legal and Constitutional Framework

KEY POINTS

The federal-state conflict over AI regulation raises fundamental constitutional questions about preemption, conditional spending, and the dormant Commerce Clause, with legal experts expressing skepticism about the administration's authority to block state laws through executive action alone.

The Limits of Executive Preemption

The constitutional doctrine of preemption derives from the Supremacy Clause, which establishes that federal law supersedes conflicting state law. However, as legal analysts at Steptoe & Johnson emphasize, "The Critical Distinction: Preemption requires federal law. An executive order, while powerful, is an instruction to the executive branch; it is not a statute passed by Congress. Therefore, an executive order alone cannot preempt state legislation."^[32]

Preemption typically falls into three categories: express preemption (where Congress explicitly states its intent to preempt state law), field preemption (where federal regulation is so comprehensive that it occupies the entire field), and conflict preemption (where state law directly conflicts with federal requirements).^[32] None of these categories applies cleanly to the current situation. There is no federal AI statute that expressly preempts state laws, no comprehensive federal regulatory scheme occupying the field of AI governance, and no direct conflict between federal requirements and Colorado's law—because there are no federal AI requirements.

As Colorado Attorney General Phil Weiser stated, "Without congressional action, there is no free-standing authority for the president to challenge state AI laws or punish states for adopting laws he doesn't like."^[35] This constitutional reality shapes the administration's strategy: rather than claiming direct preemptive effect, the executive order establishes mechanisms to challenge state laws in court and create administrative pressure for their repeal or modification.

The constitutional balance between federal and state authority.

Dormant Commerce Clause Challenges

One legal avenue the administration plans to pursue involves the dormant Commerce Clause doctrine. This constitutional principle, derived from Congress's power to regulate interstate

Colorado vs. Federal Government: The AI Regulation Showdown

commerce, prohibits states from enacting laws that unduly burden or discriminate against interstate commerce. The executive order directs the litigation task force to challenge state AI laws that "unconstitutionally regulate interstate commerce."^[3]

"AI training is an incredibly resource intensive process that cannot be done on a state-by-state basis."

Harvard Law School analysis suggests this approach may have merit in certain circumstances. "State AI laws like California's SB 53, New York's RAISE Act, and Colorado's AI Act are potentially vulnerable to legal challenges under the dormant Commerce Clause due to their substantial burden

on interstate commerce."^[4] The analysis emphasizes that "AI training is an incredibly resource intensive process" that "cannot be done on a state-by-state basis; neither OpenAI nor any other lab has the resources to train 50 models tailored to the specifications of each state."^[4]

This argument rests on the premise that AI development is inherently national (or global) in scope, and that state-specific requirements would force companies to either comply with the most restrictive state's standards nationwide or exit markets entirely. As the Harvard analysis notes, "The handful of leading models—ChatGPT, Gemini, Claude, and Grok—directly support some of the most popular apps ever created. But many other software tools also rely on these powerful models to drive their AI functions. Any changes made to core models due to AI training bills will affect the quality and functionality of many downstream AI tools."^[4]

However, dormant Commerce Clause challenges face significant obstacles. The Supreme Court has recently shown reluctance to invalidate state laws under this doctrine, particularly when those laws address legitimate local concerns. In *National Pork Producers Council v. Ross*, the Court upheld California's animal welfare standards despite their extraterritorial effects, establishing a high bar for invalidating state regulations.^[1] Moreover, as Yale Journal on Regulation notes, "Dormant commerce clause challenges are typically brought by private entities suffering economic losses, not by the federal government directly."^[3] The unusual posture of the federal government bringing such challenges may face procedural hurdles.

Conditional Spending Doctrine

The threat to withhold BEAD funding raises distinct constitutional questions under the conditional spending doctrine. The Supreme Court established in *South Dakota v. Dole* that Congress may attach conditions to federal funds, but with important limitations: the conditions must be clearly stated, reasonably related to the federal interest, and not so coercive as to constitute compulsion.^[1]

The administration's approach appears vulnerable on multiple grounds. First, the BEAD program was authorized and funded by Congress for the specific purpose of expanding broadband access, with no mention of AI regulation as a relevant consideration. Conditioning these funds on states' AI policies may fail the "reasonably related" test. Second, the sheer magnitude of the funding at stake—\$420.6 million for Colorado alone—combined with the critical need for rural internet access, could be deemed unconstitutionally coercive.

The Supreme Court addressed similar issues in *NFIB v. Sebelius*, where it struck down the Affordable Care Act's Medicaid expansion as unconstitutionally coercive because it threatened states with loss of all existing Medicaid funding if they didn't expand the program. While the Colorado situation differs (the threatened funding is new, not existing), the principle that conditional spending cannot cross the line into coercion remains relevant. As AI Certs notes, "The Supreme Court has historically limited federal power to attach new conditions to already-accepted funds."^[1]

First Amendment Considerations

The administration has suggested that state AI disclosure requirements may violate the First Amendment by compelling speech. The executive order authorizes challenges to state laws that "compel developers or deployers to disclose or report information in a manner that would violate the First Amendment."^[3] This argument frames transparency mandates as unconstitutional forced disclosure of proprietary information or compelled expression.

However, this First Amendment theory faces substantial obstacles. Courts have long recognized that commercial disclosure requirements—such as nutritional labeling, financial disclosures, and product warnings—are subject to less stringent First Amendment scrutiny than restrictions on speech. The Colorado AI Act's transparency requirements appear analogous to these established disclosure regimes. Moreover, as the Center for Democracy & Technology emphasizes, "The law does not require companies to disclose source code, training data, or intellectual property,"^[1] suggesting the requirements are narrowly tailored to legitimate consumer protection interests rather than compelling disclosure of core expressive content.

Federal Agency Authority Limitations

Colorado vs. Federal Government: The AI Regulation Showdown

The executive order's directive to federal agencies like the FCC to preempt state AI laws faces its own legal obstacles. As legal analysis from LawAI explains, "The fundamental obstacle to FCC preemption of state AI laws is that the Communications Act authorizes the FCC to regulate telecommunications services, and AI is not a telecommunications service."^[1] Federal agencies can only exercise authority granted by Congress, and existing statutes do not clearly authorize agencies to regulate AI systems broadly, let alone to preempt state AI regulations.

This limitation applies across federal agencies. The FTC's authority extends to unfair and deceptive trade practices, but this does not obviously encompass the power to preempt state consumer protection laws addressing AI discrimination. The Commerce Department's authority over broadband deployment does not naturally extend to conditioning that funding on states' AI regulatory choices. Each agency action contemplated by the executive order would likely face legal challenges based on exceeding statutory authority.

Stakeholder Positions and Political Dynamics

KEY POINTS

The conflict has mobilized diverse stakeholders across government, industry, and civil society, with Colorado officials determined to defend state authority while facing pressure from both the federal government and elements of the state's tech sector.

Colorado State Government: Divided but Defiant

Colorado's response to federal pressure reveals internal tensions while maintaining a unified front on defending state authority. Governor Jared Polis occupies a complicated position: he signed the AI Act into law but expressed significant reservations in his signing statement, acknowledging the law's "potential impact on innovation and competitiveness." Polis "initially supported a federal moratorium and still backs a national framework," yet has also expressed "encouragement that Colorado can get it right with a new bill in 2026."^[7]

Governor Polis balances tech industry concerns with consumer protection.

This ambivalence reflects Polis's background as a tech entrepreneur and his concerns about Colorado's competitiveness in attracting technology companies. As The Colorado Sun reports, "Many local tech leaders opposed the law immediately after it passed in 2024 because of the 'what-if' scenarios that could stifle innovation."^[8] Polis's creation of an AI Policy Working Group signals his preference for finding compromise rather than confrontation, seeking amendments that could address federal concerns while preserving core consumer protections.

Attorney General Phil Weiser, by contrast, has taken an uncompromising stance on defending state authority. In a November 25 letter to Congressional leaders, Weiser warned that "attempts by the federal government to coerce policy change through intimidation and the illegal withholding of funds are unlawful and unconstitutional."^[12] He has repeatedly emphasized that "without congressional action, there is no free-standing authority for the president to challenge state AI laws."^[9] and has threatened to "turn to the courts to defend the rule of law and protect the people of Colorado."^[12]

The state legislature remains committed to the law's core purposes. Representative Brianna Titone, a co-sponsor of the original bill, "said Trump doesn't have the authority to do the work of Congress."^[9] She is working on amendments that would "simplify the process of addressing inaccurate AI data by putting the liability on developers of large-scale systems, like Google and Open AI, and not the smaller companies deploying them."^[8] This approach suggests legislative willingness to refine implementation details while maintaining the fundamental framework of accountability for algorithmic discrimination.

Technology Industry: Seeking Uniformity

The technology industry has consistently opposed the Colorado AI Act, though with varying degrees of intensity and different specific concerns. Industry associations and major tech companies argue that state-by-state regulation creates an untenable compliance burden. As Ryan Saunders of the Colorado Technology

Colorado vs. Federal Government: The AI Regulation Showdown

Tech companies warn of compliance challenges under state-by-state regulation.

Association described, he received "calls from businesses developing or using AI, including some of the biggest tech companies in the country, threatening to leave the state if the bill wasn't altered."^[24]

The industry's concerns focus on several key issues. First, the breadth and ambiguity of key definitions—particularly "consequential decisions" and "algorithmic discrimination"—create uncertainty about

compliance obligations. Second, the documentation and disclosure requirements are viewed as potentially exposing proprietary information or creating excessive administrative burdens. Third, the liability framework, particularly before amendments clarifying the "reasonable care" standard, raised concerns about unpredictable legal exposure.

However, the industry position is not monolithic. Some companies, particularly those already subject to similar requirements under EU regulations, may view Colorado's law as less burdensome than the federal government portrays. The law's explicit recognition of internationally recognized frameworks like ISO 42001 provides a compliance pathway for companies already investing in responsible AI governance.^[16] Moreover, the law's focus on high-risk systems in consequential domains means many AI applications fall outside its scope entirely.

The industry's preferred outcome appears to be federal legislation establishing uniform national standards, as reflected in the executive order's call for "a minimally burdensome national standard — not 50 discordant State ones."^[9] This preference for federal preemption aligns with the administration's position, though the industry likely seeks more substantive federal standards than the "minimally burdensome" framework the administration envisions.

Civil Society and Consumer Advocates: Defending State Action

Consumer protection organizations and civil liberties groups have largely supported Colorado's law while advocating for strengthening its provisions. The Center for Democracy & Technology, while viewing the law as "a good first step," argues that "policymakers should also strengthen the law and further protect Coloradans by: building on existing civil rights protections by prohibiting the sale or sale of discriminatory AI decision systems; expanding the law's transparency provisions; strengthening impact assessment provisions; eliminating loopholes; and strengthening enforcement."^[15]

These organizations emphasize that AI systems increasingly make critical decisions affecting people's lives, often without transparency or accountability. As CDT explains, "Without proactive disclosure, most consumers don't even know when, how, or why companies use AI to make key decisions about them."^[15] They argue that the law addresses a genuine gap in consumer protection, noting that "laws often require companies to be more transparent when processes normally done by humans are automated or digitized."^[15]

”Without proactive disclosure, most consumers don't even know when, how, or why companies use AI to make key decisions about them.”

Civil society groups view the federal government's intervention as inappropriate federal overreach. They emphasize that states have traditionally served as "laboratories of democracy" in consumer protection, with state laws often preceding and informing federal standards. The aggressive federal response to Colorado's law, in this view, represents an attempt to prevent states from addressing emerging harms before federal action materializes—if it ever does.

Rural and Broadband Stakeholders: Caught in the Crossfire

Colorado Broadband Access Impact (households)

Colorado vs. Federal Government: The AI Regulation Showdown

Rural Colorado communities and broadband advocates find themselves in an uncomfortable position, with their critical infrastructure needs weaponized in a regulatory dispute over AI. The \$420.6 million in BEAD funding at risk would "connect approximately 96,000 Coloradans to high-speed internet,"^[27] addressing a digital divide that the COVID-19 pandemic starkly exposed.

Rural broadband expansion is critical for Colorado communities.

Garfield County's experience illustrates the stakes. The county "has worked for more than six years to expand broadband access, investing \$5 million in the construction of network infrastructure."^[28] County officials note that "prior to the NTIA's recent restructuring, 100% of our 4,000 unserved and underserved addresses were slated for grant-funded, symmetrical gigabit service."^[28] The potential loss of federal funding would devastate these carefully developed plans.

However, rural stakeholders have limited leverage in this dispute. They are not parties to the AI regulation debate and have no direct influence over whether Colorado maintains or modifies its AI law. Their infrastructure needs are being used as leverage in a conflict over consumer protection policy in which they have no stake. This dynamic has generated frustration, with some rural advocates viewing the funding threat as holding their communities hostage to unrelated policy disputes.

Federal Government: Unified Executive Branch Position

The Trump administration has presented a unified position across executive branch agencies, framing state AI regulation as a threat to American competitiveness and national security. The administration's rhetoric emphasizes the global AI race with China, arguing that "we remain in the earliest days of this technological revolution and are in a race with adversaries for supremacy within it."^[5] This national security framing attempts to elevate the issue beyond ordinary federal-state regulatory disputes.

The administration's position reflects several policy commitments: prioritizing innovation and economic growth over precautionary regulation, preferring industry self-regulation to government mandates, and asserting federal primacy over emerging technology governance. As the executive order states, the policy is "to sustain and enhance the United States' global AI dominance through a minimally burdensome national policy framework for AI."^[9]

However, the administration's position has not been uniformly embraced across the political spectrum. A bipartisan coalition of 36 state attorneys general previously pushed back against federal attempts to block state AI laws,^[6] suggesting that concerns about federal overreach transcend partisan lines. Even some Republican governors, like Florida's Ron DeSantis, have "signaled that President Trump's EO on AI will not deter Florida from advancing its own AI policies, particularly in areas such as child safety and consumer protection."^[3]

Other States: Watching and Waiting

Colorado's experience has significant implications for other states considering AI regulation. Over 1,000 AI bills were introduced in state legislatures in 2025, with 73 new AI statutes enacted across 27 states.^[11] Many of these laws address specific domains like child safety or government procurement, but several states have considered comprehensive AI accountability frameworks similar to Colorado's.

California, in particular, has been actively debating AI regulation, with multiple bills addressing different aspects of AI governance. The fate of Colorado's law will likely influence California's legislative trajectory and that of other states. If Colorado successfully implements its law despite federal opposition, it could embolden other states to proceed with their own regulations. Conversely, if Colorado is forced to substantially weaken or abandon its law, other states may hesitate to enact similar measures.

The multi-state dimension adds complexity to the federal government's strategy. While the administration can focus litigation and pressure on Colorado as the first mover, a coordinated response from multiple states would present a more formidable challenge. The executive order's mechanisms—litigation task force, funding conditions, agency coordination—would become increasingly strained if deployed against numerous states simultaneously.

Economic Impacts and Compliance Challenges

KEY POINTS

The conflict creates significant economic uncertainty for Colorado businesses and threatens critical rural infrastructure funding, while raising broader questions about the costs and benefits of AI regulation.

Compliance Costs and Business Impacts

AI development requires significant resources and expertise.

The Colorado AI Act imposes compliance costs that vary dramatically depending on company size, existing practices, and the nature of AI systems deployed. For large technology companies already subject to EU AI Act requirements or investing in responsible AI frameworks, Colorado's law may represent an incremental rather than transformative burden. These companies often have dedicated legal and compliance teams, established

documentation practices, and resources to conduct impact assessments.

For smaller businesses and startups, however, the compliance challenges are more acute. As the administration's executive order argues, state-by-state regulation "makes compliance more challenging, particularly for start-ups."^[9] A Colorado AI Task Force report identified several implementation challenges, including that "smaller businesses may face challenges" and "questions remain about enforcement scope."^[10] The documentation requirements, impact assessments, and risk management obligations all require expertise and resources that smaller entities may struggle to provide.

The law's definition of "high-risk" systems and "consequential decisions" creates uncertainty about which business processes fall within scope. As Fisher Phillips notes, "One key area of ongoing discussion is the definition of 'consequential decisions,' which determines which AI-driven business processes fall under the law's purview." This ambiguity makes it difficult for businesses to assess their compliance obligations and associated costs.

Some businesses have threatened to relocate or reduce operations in Colorado if the law proceeds unchanged. Ryan Saunders of the Colorado Technology Association reported receiving calls from "some of the biggest tech companies in the country, threatening to leave the state if the bill wasn't altered."^[11] Whether these threats would materialize remains uncertain, as relocating operations involves substantial costs and disruption, and companies may face similar regulations in other states.

The \$420.6 Million Question

Rural communities depend on federal funding for broadband infrastructure.

The threatened loss of BEAD funding represents the most immediate and quantifiable economic impact of the federal-state conflict. The \$420.6 million at stake would fund broadband expansion to approximately 96,000 Coloradans in unserved or underserved areas.^[12] The economic value of this infrastructure extends beyond the direct funding amount, as broadband access enables remote work, education, healthcare, and economic development in rural communities.

The funding reduction from the originally allocated \$826 million to \$420.6 million already represents a significant loss for Colorado.^[13] Further reduction or elimination of this funding would devastate rural broadband expansion plans. Garfield County's experience illustrates the

Colorado vs. Federal Government: The AI Regulation Showdown

ripple effects: after investing \$5 million in network infrastructure over six years, the county faces potential loss of federal funding that would complete the last-mile connections.^[28]

The economic calculus for Colorado policymakers involves weighing the benefits of the AI Act—consumer protection, reduced discrimination, increased transparency—against the concrete loss of rural broadband funding. This trade-off is complicated by uncertainty about whether the funding threat is legally sustainable and whether the federal government would actually follow through on withholding funds.

Labor Market Effects

The broader context of AI's impact on Colorado's labor market adds urgency to the regulatory debate. As The Colorado Sun reports, "The unemployment rate for new entrants hit a nine-year high of 13.4% in 2025, with AI being widely blamed for job market difficulties."^[24] This statistic reflects growing concerns about AI's displacement effects, particularly for entry-level workers and those seeking to change careers.

13.4%
Unemployment Rate for
New Entrants (2025)

The AI Act's focus on employment decisions—requiring transparency and non-discrimination in hiring, promotion, and termination decisions made by AI systems—directly addresses these labor market concerns. Proponents argue that without regulation, AI systems may perpetuate or amplify existing biases, making it even harder for disadvantaged groups to access employment opportunities. The law's requirement that individuals rejected through AI-driven decisions receive "the 'principal reasons' for the decision, the degree to which and manner in which AI played a role in that decision, and what personal data was processed in making the decision"^[15] provides workers with information to challenge potentially discriminatory outcomes.

Comparative Economic Analysis

Comparing Colorado's approach to other jurisdictions provides context for assessing economic impacts. The EU AI Act, which establishes comprehensive requirements for high-risk AI systems, has not prevented European companies from competing in global AI markets, though it has imposed compliance costs and influenced product development decisions. The EU's experience suggests that well-designed regulation need not be incompatible with innovation, though the optimal balance remains contested.

The absence of comprehensive federal AI regulation in the United States creates a regulatory arbitrage situation where companies can potentially avoid state requirements by limiting operations in regulated states or structuring their business models to fall outside regulatory scope. This dynamic may reduce the effectiveness of state-level regulation while creating competitive distortions between companies subject to different regulatory regimes.

Resolution Pathways and Future Scenarios

KEY POINTS

With the June 30, 2026 deadline approaching, multiple resolution pathways exist, ranging from negotiated compromise to protracted litigation, each with distinct implications for AI governance and federalism.

Negotiated Compromise

The most likely near-term outcome involves negotiated amendments to the Colorado AI Act that address some federal concerns while preserving core consumer protections. Governor Polis's AI Policy Working Group represents the institutional framework for such negotiations, bringing together state officials, industry representatives, and consumer advocates.^[7] Representative Titone's work on a "repeal and replace" bill focusing liability on large-scale AI developers rather than deployers^[8] illustrates one potential compromise direction.

A negotiated settlement might involve several elements: narrowing the definition of "algorithmic discrimination" to align more closely with existing anti-discrimination law, clarifying that the law does not require disclosure of proprietary algorithms or training data, providing more explicit safe harbors for companies following recognized risk management frameworks, and potentially limiting enforcement during an extended transition period.

However, significant obstacles to compromise remain. As The Colorado Sun reports, "key disagreements over who should be held liable when AI systems discriminate remain unresolved."^[22] Industry stakeholders seek maximum liability protection and minimal

Colorado vs. Federal Government: The AI Regulation Showdown

disclosure requirements, while consumer advocates resist weakening the law's accountability mechanisms. The federal government's aggressive posture may actually complicate compromise by emboldening opponents of any state regulation.

Litigation Scenarios

If compromise fails, litigation appears inevitable. The AI Litigation Task Force established by the executive order is specifically tasked with challenging state AI laws,^[9] and Colorado's Attorney General has promised to defend the law in court.^[12] Potential litigation could proceed on multiple fronts.

Dormant Commerce Clause challenges would argue that Colorado's law impermissibly burdens interstate commerce by forcing companies to alter AI systems used nationally to comply with Colorado's requirements. The success of such challenges depends on whether courts view AI development as inherently unitary (supporting the federal position) or whether companies can reasonably implement state-specific compliance measures (supporting Colorado's position). Recent Supreme Court precedent in *National Pork Producers Council v. Ross* suggests courts may be reluctant to invalidate state laws addressing legitimate local concerns, even when those laws have extraterritorial effects.^[1]

"The leverage applied through federal grants will be the key political mechanism for driving state-level change."

Preemption challenges face the fundamental obstacle that there is no federal AI statute to serve as the basis for preemption. The federal government might argue that existing sector-specific regulations (financial services, healthcare, etc.) already address AI-related concerns and therefore preempt state action, but this argument would require demonstrating that federal regulators have comprehensively addressed AI risks—a difficult showing given the limited federal AI regulation to date.

Conditional spending challenges to the BEAD funding threat could be brought by Colorado or affected rural communities, arguing that the funding condition is not reasonably related to the program's purpose and is unconstitutionally coercive. Such litigation could proceed independently of challenges to the AI Act itself, potentially forcing the federal government to either abandon the funding threat or defend it in court.

The timeline for litigation resolution extends well beyond the June 30, 2026 implementation date. As legal analysts note, "The leverage applied through federal grants will be the key political mechanism for driving state-level change,"^[32] but litigation over that leverage could take years to resolve. In the interim, Colorado would face the choice of implementing the law while litigation proceeds or delaying implementation pending judicial resolution.

Federal Legislative Preemption

The administration's ultimate goal appears to be federal legislation establishing uniform national AI standards that would preempt conflicting state laws. The executive order directs officials to "provide legislative recommendations to the Congress to establish a uniform Federal AI policy framework that would pre-empt conflicting State laws."^[18] Such legislation could resolve the current conflict by establishing clear federal standards that supersede state requirements.

However, federal AI legislation faces significant obstacles. Despite over 150 AI bills introduced in the 118th Congress, "not one passed."^[12] The 119th Congress has seen similar legislative activity with similarly limited results. Partisan divisions, industry lobbying, and disagreement over appropriate regulatory approaches have prevented consensus on federal AI legislation.

Moreover, the substance of any federal legislation matters enormously. A "minimally burdensome" federal framework that preempts state action without establishing meaningful protections would represent a victory for industry but a defeat for consumer advocates. Conversely, comprehensive federal legislation incorporating elements of state approaches like Colorado's could provide the regulatory clarity industry seeks while preserving consumer protections. The political dynamics suggest that any federal legislation would involve significant compromise, potentially satisfying neither side fully.

State Defiance and Multi-State Coordination

Colorado could choose to implement its law on June 30, 2026, regardless of federal threats, forcing the administration to follow through on litigation and funding restrictions. This defiance strategy would test the federal government's resolve and legal theories while demonstrating state commitment to consumer protection. Attorney General Weiser's statements suggest willingness to pursue this path: "If the administration proceeds to adopt this draft order, we will again turn to the courts to defend the rule of law and protect the people of Colorado."^[12]

A defiance strategy gains strength if other states join Colorado in implementing similar laws. Florida Governor Ron DeSantis has already signaled that "President Trump's EO on AI will not deter Florida from advancing its own AI policies."^[3] If multiple states proceed with AI

Colorado vs. Federal Government: The AI Regulation Showdown

Attorney General Weiser has vowed to defend Colorado's law in court.

regulation despite federal opposition, the administration's litigation and pressure strategies become more difficult to sustain. A coordinated multi-state approach could also support legal challenges to federal actions, with states filing amicus briefs or joining litigation as co-parties.

However, defiance carries risks. If Colorado loses in court, it could establish precedents limiting state authority over AI

regulation nationwide. The loss of BEAD funding would have real consequences for rural communities. And prolonged uncertainty about regulatory requirements creates difficulties for businesses attempting to plan compliance strategies.

Delay and Reassessment

Colorado could choose to delay implementation beyond June 30, 2026, providing additional time for negotiation, federal legislative developments, or litigation resolution. The legislature has already delayed implementation once, from February to June 2026,^[5] and could do so again. This approach would reduce immediate pressure while maintaining the law's framework as a negotiating position.

However, repeated delays risk undermining the law's credibility and creating perception that Colorado is retreating under federal pressure. Consumer advocates who supported the law may view further delays as capitulation. Moreover, delay does not resolve the underlying conflict—the federal government's opposition to state AI regulation would persist regardless of implementation timing.

Broader Implications for AI Governance and Federalism

KEY POINTS

The Colorado conflict represents a critical test case for how emerging technologies will be governed in the American federal system, with implications extending far beyond AI regulation to fundamental questions about state authority and innovation policy.

Precedent for Technology Regulation

The resolution of this conflict will establish important precedents for state authority over emerging technologies. If Colorado successfully implements its AI law despite federal opposition, it would demonstrate that states retain meaningful authority to regulate novel technologies even when the federal government prefers a hands-off approach. This outcome would encourage other states to pursue their own regulatory initiatives, potentially creating the "patchwork" of state laws that industry and the federal government warn against.

The federal system balances power between national and state governments.

Conversely, if federal pressure forces Colorado to abandon or substantially weaken its law, it would signal that states have limited practical ability to regulate technologies that the federal government views as strategically important. This outcome would shift the locus of technology governance decisively toward the federal level, even in the absence of federal legislation establishing substantive standards.

The conflict also raises questions about the appropriate balance between innovation and regulation. The administration's framing emphasizes that "United States AI companies must be free to innovate without cumbersome regulation,"^[9] reflecting a view that regulation inherently impedes technological progress. Colorado's approach, by contrast, reflects the view that regulation can channel innovation in socially beneficial directions by preventing harms like discrimination while allowing beneficial applications to proceed.

Federalism and the Laboratories of Democracy

Colorado vs. Federal Government: The AI Regulation Showdown

Justice Brandeis's famous description of states as "laboratories of democracy" rests on the premise that states can experiment with different policy approaches, with successful innovations informing national policy and unsuccessful experiments remaining localized. Colorado's AI Act represents exactly this kind of state-level experimentation—an attempt to address emerging risks through novel regulatory mechanisms.

“States have served as laboratories of democracy, experimenting with novel regulatory approaches that can later inform national policy.”

The federal government's aggressive intervention disrupts this laboratory function. By threatening litigation and funding restrictions before Colorado has even implemented its law, the administration prevents the state from conducting the experiment and generating evidence about the law's effects. As the New York Law Journal notes, "Historically, states have served as laboratories of

democracy, experimenting with novel regulatory approaches that can later inform national policy.”^[30]
This dynamic has implications beyond AI. If the federal government can effectively prevent state experimentation with technology regulation through executive action alone, the laboratories of democracy function becomes significantly constrained. States would have limited ability to address emerging risks until the federal government acts—and if the federal government prefers minimal regulation, states would be unable to provide greater protections even when their citizens demand them.

International Competitiveness and Regulatory Divergence

The administration justifies its opposition to state AI regulation partly on competitiveness grounds, arguing that regulatory burdens disadvantage American companies in the global AI race. However, this argument overlooks that many American companies already navigate complex international regulatory environments, including the EU AI Act, which imposes requirements similar to or more extensive than Colorado's law.
As William Fry's analysis notes, "For multinational organisations, the order underscores the divergence between the US regulatory trajectory and that of other major jurisdictions, most notably the European Union."^[10] While the EU establishes comprehensive risk-based regulation, the U.S. approach under the current administration emphasizes minimal federal regulation combined with efforts to prevent state-level requirements. This divergence creates its own compliance challenges for companies operating globally.
Moreover, the competitiveness argument assumes that regulation necessarily impedes innovation, when evidence suggests more complex relationships. Regulation can drive innovation by creating markets for compliance solutions, establishing trust that enables broader adoption, and preventing harms that could trigger public backlash against technology. The EU's experience with GDPR illustrates how regulation can coexist with continued technological development, though debates about optimal regulatory approaches continue.

The Future of AI Governance

AI systems increasingly make consequential decisions across multiple domains.

The Colorado conflict occurs against a backdrop of rapid AI advancement and growing public concern about AI risks. The unemployment rate for new entrants hitting a nine-year high of 13.4% in 2025, "with AI being widely blamed for job market difficulties,"^[24] reflects broader anxieties about AI's societal impacts. The question of who should regulate AI—federal government, states, industry self-regulation, or some combination—remains unresolved.
The absence of federal AI legislation creates a governance vacuum that states like Colorado are attempting to fill. However, the administration's response suggests that this vacuum may be intentional—a preference for minimal regulation rather than a temporary gap pending federal action. This raises fundamental questions about whether the U.S. will develop comprehensive AI governance frameworks or maintain a largely unregulated approach.
International developments add pressure for the U.S. to clarify its AI governance approach. The EU AI Act, set to be fully implemented in coming years, establishes comprehensive

Colorado vs. Federal Government: The AI Regulation Showdown

requirements that will affect American companies operating in European markets. Other countries are developing their own AI governance frameworks. The U.S. risks being left behind in shaping global AI governance norms if internal federal-state conflicts prevent coherent policy development.

Conclusion

As Colorado approaches the June 30, 2026 implementation deadline for its AI Act, the state stands at a crossroads with national implications. The conflict pits state authority to protect consumers against federal assertions of primacy over emerging technology governance, with neither side showing signs of backing down. Attorney General Weiser has promised to defend the law in court, while the Trump administration has established dedicated mechanisms to challenge state AI regulations and threatened to withhold hundreds of millions in rural broadband funding.

The Trump administration's executive order has escalated federal-state tensions.

The legal landscape favors neither side decisively. The federal government lacks direct authority to preempt state laws through executive action alone, but possesses multiple tools to create pressure for state capitulation. Colorado has constitutional authority to regulate within its borders, but faces practical constraints from the threat of litigation, funding loss, and potential business exodus. The resolution will likely involve some combination of negotiated compromise, litigation, and political maneuvering, with outcomes that remain genuinely uncertain.

What is clear is that this conflict transcends the specifics of AI regulation to address fundamental questions about American federalism, technology governance, and the balance between innovation and consumer protection. The precedents established will influence not only how AI is regulated but how emerging technologies more broadly are governed in the American federal system. As states watch Colorado's experience, they are assessing their own appetite for technology regulation in the face of potential federal opposition.

For Colorado stakeholders—from state officials to rural communities to technology companies—the coming months will require difficult choices. The state must decide whether to implement its law as scheduled, seek compromise amendments, or delay further. Rural communities must weigh their infrastructure needs against the state's consumer protection goals. Technology companies must prepare for potential compliance obligations while hoping for resolution that provides regulatory clarity. And Colorado citizens must consider whether their state's pioneering approach to AI accountability is worth the potential costs in federal funding and business climate.

The stakes extend beyond Colorado's borders. In an era of rapid technological change, the question of who governs emerging technologies—and how—will shape not only economic competitiveness but fundamental questions about fairness, transparency, and accountability in an increasingly AI-mediated world. Colorado's experience will provide critical lessons about whether state-level innovation in technology regulation can survive federal opposition, or whether technology governance will be effectively centralized at the federal level regardless of congressional action. The answer will emerge in the coming months as this unprecedented federal-state confrontation over AI regulation unfolds. ■
