BELOW GRADE WATER CONTROL VALVE VAULTS

Below grade water control valve vaults are engineered to support a wide range of municipal and treatment system applications, providing a secure, protected environment for critical hydraulic equipment. Each vault is designed to house pressure control assemblies, metering devices, and isolation valves, enabling operators to manage and monitor system hydraulics with efficiency, accuracy, and reliability.

Constructed for strength, operator safety, and long term performance, vaults incorporate advanced options such as cathodic protection, specialized corrosion-resistant coatings, and integrated environmental systems to control moisture and vapor.

Access is tailored to site specific requirements, with ladder or stairway entry and built-in safety provisions that promote ease of operation, inspection, and maintenance.

FEATURES

- Protection from Extreme Weather
- Space Savings
- Aesthetic Considerations
- Good Around Geological Restricted Areas
- Safety and Security
- Temperature Stability
- NSF 61/372 Options

OUR VALUES

People First • Excellence • Commitment • Entrepreneurial • Teamwork
