learning objectives:

1. Understand the embodied carbon impact of existing, historic buildings.
2. Gain resources on sustainable tactics for renovating historic buildings.
3. Learn how to work with the State Historic Preservation Office for a smoother process and successful outcome.
4. Learn how to create a Net Positive renovation while keeping the historic integrity.

SET THE STAGE

Figure [1.1] Overview of GHG Protocol scopes and emissions across the value chain

Targeting Net-Zero Embodied Carbon

This document provides an overview of three types of embodied carbon reduction targets, and also examples of corporate and other voluntary commitments to reduce embodied carbon. More information about opportunities for addressing embodied carbon with policy can be found in the [Carbon Leadership Forum's Owner Toolkit](#).

Target-setting is key to success and momentum

Investor, developer, building owner, and tenant policies are essential to reducing embodied carbon by spurring action before a project begins when the largest range of solutions are available. As a project progresses, the range of options is reduced. Setting net-zero embodied carbon targets early in a project (preferably before it begins) is therefore key to maximizing reductions and minimizing costs.

When it comes to targeting net-zero embodied carbon, there are three relevant types of targets:

1. Company or organization-wide targets;
2. Project-level targets; and
3. Material-level (procurement) targets.

Organization-wide targets are most effective at accelerating action through aligning teams across an organization that may otherwise be siloed, such as sustainability, real estate, and procurement. Project and procurement targets support broader goals and ensure that reductions opportunities are followed through the value chain and communicated as a priority across the large number of stakeholders across a typical project.

Public sustainability commitments can also help maintain momentum on climate action within a company while signaling demand for low carbon solutions, inspiring a "race to the top" among organizations competing to be the first to net-zero.

Embodied carbon and scope 3 emissions

Embodied carbon refers to the greenhouse gas emissions associated with the manufacturing, transportation, use, and disposal of building materials used in construction.

The Greenhouse Gas Protocol Corporate Accounting and Reporting Standard splits GHG emissions into three scopes:

- **Scope 1** emissions are from a company's operations that are under a facility's direct control, e.g., on-site fuel combustion;
- **Scope 2** emissions are from usage of electricity, steam, heat and/or cooling purchased from third parties; and
- **Scope 3** emissions are upstream and downstream value chain emissions, including upstream supply chain emissions from purchased products, transport emissions, and business travel and downstream emissions from transport of products, usage of sold products and product disposal.

Upfront or "cradle-to-gate" embodied carbon refers to embodied carbon impacts up to the point of purchasing, and are therefore accounted as scope 3 emissions (see Figure 1). The primary categories of scope 3 emissions associated with embodied carbon are (1) purchased goods and services and (2) capital goods, or assets that are used to produce goods or services.

Figure 1. Building product life cycle stages included in scope 1, 2, and 3 greenhouse gas accounting, as described by the [Greenhouse Gas Protocol Corporate Value Chain \(Scope 3\) Reporting Standard](#). Cradle-to-gate emissions (including extraction, transportation, and production) as well as end-of-life waste disposal and recycling emissions are included in scope 3 emissions. Other life cycle stages, such as construction and demolition, are not clearly attributable to a category.

Targeting Net-Zero Embodied Carbon

This document provides an overview of three types of embodied carbon reduction targets, and also examples of corporate and other voluntary commitments to reduce embodied carbon. More information about opportunities for addressing embodied carbon with policy can be found in the [Carbon Leadership Forum's Owner Toolkit](#).

Target-setting is key to success and momentum

Investor, developer, building owner, and tenant policies are essential to reducing embodied carbon by spurring action before a project begins when the largest range of solutions are available. As a project progresses, the range of options is reduced. Setting net-zero embodied carbon targets early in a project (preferably before it begins) is therefore key to maximizing reductions and minimizing costs.

When it comes to targeting net-zero embodied carbon, there are three relevant types of targets:

1. Company or organization-wide targets;

Upfront or "cradle-to-gate" embodied carbon refers to embodied carbon impacts up to the point of purchasing, and are therefore accounted as scope 3 emissions (see Figure 1). The primary categories of scope 3 emissions associated with embodied carbon are (1) purchased goods and services and (2) capital goods, or assets that are used to produce goods or services.

Figure 1. Building product life cycle stages included in scope 1, 2, and 3 greenhouse gas accounting, as described by the [Greenhouse Gas Protocol Corporate Value Chain \(Scope 3\) Reporting Standard](#). Cradle-to-gate emissions (including extraction, transportation, and production) as well as end-of-life waste disposal and recycling emissions are included in scope 3 emissions. Other life cycle stages, such as construction and demolition, are not clearly attributable to a category.

The following sections provide an outline of the tools and accounting methodologies that are helpful for setting company, project, and material-level targets.

Company/organization-wide targets

GHG accounting and target-setting is an integral part of corporate sustainability and reporting. The [GHG Protocol Corporate Accounting and Reporting Standard](#) is used by companies, cities, universities, and other entities to report GHG emissions. Standards like the [Global Reporting Initiative \(GRI\)](#) and the [Sustainability Accounting Standards Board \(SASB\)](#) help define what companies must report in their annual sustainability report and how GHG emissions are accounted. Corporate accountability initiatives encourage companies to take additional actions such as setting meaningful targets (see the [Science Based Targets Initiative \(SBTI\)](#)) or procuring 100% renewable energy (see [IE190](#)).

Until recently, GHG accountability initiatives have focused on emissions from direct or indirect energy use, also known as scope 1 and 2 emissions. However, increasing public pressure to do more holistic GHG accounting has resulted in a growing number of companies expanding their scope of GHG accounting and public sustainability commitments to include value chain (scope 3) emissions. According to SBTi, "Setting value chain targets (scope 3 targets) is now standard practice; 94% of companies with science-based targets include scope 3 emissions" ([source](#)).

While scope 3 emissions targets are becoming increasingly popular, setting targets explicitly focused on embodied carbon or through green building certifications that require embodied carbon reductions, such as the Zero Carbon Certification, provide additional pathways for targeting net-zero. Table 1 highlights examples of building owner commitments that address embodied carbon.

Project-level targets

Project-level embodied carbon targets should be set before a project begins and communicated in owner's project requirements. There are two primary approaches to setting project-level targets:

1. A **carbon intensity limit** sets a maximum carbon footprint per area value for a building. For example, the [Zero Carbon Certification](#) requires that "[t]he total embodied carbon emissions of the project must not exceed 500 kg-CO₂e/m²."
2. **Percent reduction goals** from a baseline value can be set for the entire project or on a per area basis. For example, the LEED v4 credit "[Building life-cycle impact reduction](#)" awards points to teams that "conduct a life-cycle assessment of the project's structure and enclosure that demonstrates a minimum of 10% reduction, compared with a baseline building."

Table 1. Examples of building owner commitments that include embodied carbon reductions. Many companies have chosen to develop Science Based Targets related to scope 3 emissions that cover building materials, while others have made commitments specifically related to embodied carbon in the context of green building policies.

Owner	Goal
Amazon	Amazon co-founded The Climate Pledge, which is a commitment to net-zero carbon across their business by 2040 (including scopes 1, 2, and 3).
Autodesk	Autodesk aims to achieve climate-neutral GHG emissions for scopes 1, 2, and 3 beginning in FY21 using an internal price on carbon. Their target is to achieve an 85% reduction by 2050.
Facebook	Facebook is committed to reaching net-zero GHG emissions for their value chain (scope 3) by 2030.
Hewlett Packard	Hewlett Packard is committed to becoming carbon-neutral by 2050, covering scope 1, 2, and 3 emissions. Their 2025 climate targets include a 15% reduction in manufacturing-related GHG emissions in their supply chain from 2016 levels.
Kilroy Realty	Kilroy aims to reduce the embodied carbon of construction materials in development projects 30% like-for-like by year-end 2040 and 50% by year-end 2050 from a 2019 baseline. They are also aiming to reduce their scope 3 emissions by 72% by 2050.
Lendlease	Lendlease aims to achieve net zero carbon by 2025 for scope 1 and 2 and absolute zero carbon by 2040 from all scopes and activities without the use of offsets.
LinkedIn	LinkedIn aims to reduce their scope 3 emissions by more than half and remove more carbon than they emit by 2030.
Mastercard	Mastercard is working to reduce total scope 1 and 2 emissions by 38% and scope 3 emissions by 20% by 2025 from a 2016 baseline.
Microsoft	Microsoft aims to drive its operations and supply chain to be carbon-negative by 2030.
Salesforce	By 2025, Salesforce will work with their suppliers to set their own emissions reduction targets, targeting 50% of Salesforce's supplier emissions. After 2020, all major, new Salesforce office interiors will align with LEED Platinum v4 and pursue Net Zero Carbon certification.
University of Michigan	The University of Michigan will establish, by 2025, carbon neutrality goal dates for scope 3 emissions categories that are set for no later than 2040.
Walmart	Walmart is working with suppliers through their Project Gigaton to avoid a gigaton of GHG emissions from the global value chain by 2030.

The embodied carbon of a project can be calculated by using whole building life cycle assessment (WBLCA) tools, such as [Tally](#), [OneClickCLC](#), and others. WBLCA analysis should be included in the scope of work for the project, to be led by the architect, engineer, and/or sustainability consultant. [Learn more about WBLCA in the Carbon Leadership Forum's Practice Guide](#).

Analyzing data from past projects is ideal for providing meaningful carbon intensity limits or reduction goals. As of April 2021, there is no publicly available database of building life cycle assessments to provide embodied carbon benchmarks at the building scale. The [Embodied Carbon Benchmark Study](#) compiled over 1000 buildings to establish consensus on the order of magnitude of typical building embodied carbon. Additional research is needed to provide benchmark numbers similar those available for operational energy.

Material-level targets

Procurement targets should be set during the design process and included in specifications. Similar to project-level targets, two approaches can be used:

1. A **material carbon intensity limit** sets a maximum carbon footprint per unit of material, such as a cubic yard of concrete. For example, the [State of California](#) requires that rebar purchased for State projects must be below the global warming potential limit of 1.06 metric tons CO₂e per metric ton of rebar.
2. **Percent reduction goals** from a baseline value can be set in total or per functional unit of material. For example, the LEED BD+C New Construction pilot credit "[Procurement of Low Carbon Construction Materials](#)" awards teams 1 point for reductions of 0-30% and 2 points for reductions above 30% from the Carbon Leadership Forum's Material Baselines values.

Product embodied carbon should be tracked via product-specific environmental product declarations, rather than whole building life cycle assessment tools. Learn more in [Procurement Policies to Reduce Embodied Carbon](#).

Voluntary Embodied Carbon Commitments

While many building owners may choose to develop embodied carbon targets as part of broader initiatives like Science Based Targets or their corporate green building policies, the 2030 Challenge for Embodied Carbon and the Clean Construction Declaration are two examples of commitments that include targets specific to embodied carbon in construction.

The [2030 Challenge for Embodied Carbon](#) from Architecture 2030 asks the global architecture and building community to adopt the following commitment:

The embodied carbon emissions from all buildings, infrastructure, and associated materials shall immediately meet a maximum global warming potential (GWP) of **40% below the industry average today**. The GWP reduction shall be increased to:

- 45% or better in 2025
- 65% or better in 2030
- Zero GWP by 2040.

Signatories to the [Clean Construction Declaration](#) from C40 Cities pledge to "bring together and inspire stakeholders to take action, and enact policies and regulations where we have the powers to:

- Reduce embodied emissions by at least 50% for all new buildings and major retrofits by 2030, striving for at least 30% by 2025
- Reduce embodied emissions by at least 50% of all infrastructure projects by 2030, striving for at least 30% by 2025
- Procure and, when possible, use only zero emission construction machinery from 2025 and require zero emission construction sites city-wide by 2030."

Targeting Net-Zero Embodied Carbon

This document provides an overview of three types of embodied carbon reduction targets, and also examples of corporate and other voluntary commitments to reduce embodied carbon. More information about opportunities for addressing embodied carbon with policy can be found in the [Carbon Leadership Forum's Owner Toolkit](#).

Target-setting is key to success and momentum

Investor, developer, building owner, and tenant policies are essential to reducing embodied carbon by spurring action before a project begins when the largest range of solutions are available. As a project progresses, the range of options is reduced. Setting net-zero embodied carbon targets early in a project (preferably before it begins) is therefore key to maximizing reductions and minimizing costs.

When it comes to targeting net-zero embodied carbon, there are three relevant types of targets:

1. Company or organization-wide targets;
2. Project-level targets; and
3. Material-level (procurement) targets.

Organization-wide targets are most effective at accelerating action through aligning teams across an organization that may otherwise be siloed, such as sustainability, real estate, and procurement. Project and procurement targets support broader goals and ensure that reductions opportunities are followed through the value chain and communicated as a priority across the large number of stakeholders across a typical project.

Public sustainability commitments can also help maintain momentum on climate action within a company while signaling demand for low carbon solutions, inspiring a "race to the top" among organizations competing to be the first to net-zero.

Embodied carbon and scope 3 emissions

Embodied carbon refers to the greenhouse gas emissions associated with the manufacturing, transportation, use, and disposal of building materials used in construction.

The Greenhouse Gas Protocol Corporate Accounting and Reporting Standard splits GHG emissions into three scopes:

- **Scope 1** emissions are from a company's operations that are under a facility's direct control, e.g., on-site fuel combustion;
- **Scope 2** emissions are from usage of electricity, steam, heat and/or cooling purchased from third parties; and
- **Scope 3** emissions are upstream and downstream value chain emissions, including upstream supply chain emissions from purchased products, transport emissions, and business travel and downstream emissions from transport of products, usage of sold products and product disposal.

Upfront or "cradle-to-gate" embodied carbon refers to embodied carbon impacts up to the point of purchasing, and are therefore accounted as scope 3 emissions (see Figure 1). The primary categories of scope 3 emissions associated with embodied carbon are (1) purchased goods and services and (2) capital goods, or assets that are used to produce goods or services.

Figure 1. Building product life cycle stages included in scope 1, 2, and 3 greenhouse gas accounting, as described by the [Greenhouse Gas Protocol Corporate Value Chain \(Scope 3\) Reporting Standard](#). Cradle-to-gate emissions (including extraction, transportation, and production) as well as end-of-life waste disposal and recycling emissions are included in scope 3 emissions. Other life cycle stages, such as construction and demolition, are not clearly attributable to a category.

The following sections provide an outline of the tools and accounting methodologies that are helpful for setting company, project, and material-level targets.

Company/organization-wide targets

GHG accounting and target-setting is an integral part of corporate sustainability and reporting. The [GHG Protocol Corporate Accounting and Reporting Standard](#) is used by companies, cities, universities, and other entities to report GHG emissions. Standards like the [Global Reporting Initiative \(GRI\)](#) and the [Sustainability Accounting Standards Board \(SASB\)](#) help define what companies must report in their annual sustainability report and how GHG emissions are accounted. Corporate accountability initiatives encourage companies to take additional actions such as setting meaningful targets (see the [Science Based Targets Initiative \(SBTI\)](#)) or procuring 100% renewable energy (see [IE190](#)).

Until recently, GHG accountability initiatives have focused on emissions from direct or indirect energy use, also known as scope 1 and 2 emissions. However, increasing public pressure to do more holistic GHG accounting has resulted in a growing number of companies expanding their scope of GHG accounting and public sustainability commitments to include value chain (scope 3) emissions. According to SBTi, "Setting value chain targets (scope 3 targets) is now standard practice; 94% of companies with science-based targets include scope 3 emissions" ([source](#)).

While scope 3 emissions targets are becoming increasingly popular, setting targets explicitly focused on embodied carbon or through green building certifications that require embodied carbon reductions, such as the Zero Carbon Certification, provide additional pathways for targeting net-zero. Table 1 highlights examples of building owner commitments that address embodied carbon.

Project-level targets

Project-level embodied carbon targets should be set before a project begins and communicated in owner's project requirements. There are two primary approaches to setting project-level targets:

1. A **carbon intensity limit** sets a maximum carbon footprint per area value for a building. For example, the [Zero Carbon Certification](#) requires that "[t]he total embodied carbon emissions of the project must not exceed 500 kg-CO₂e/m²."

**HOW HISTORIC TAX
CREDITS FUNDING
WORKS**

Why the Historic Tax Credit?

Adaptive reuse repurposes dormant community assets, leveraging cultural heritage and attracting private capital

75% of the economic benefits of HTC projects generate local benefits: materials and wages

Historic building rehabilitations are more labor intensive than new construction: higher skilled workers + higher wages

Restoring underutilized buildings sets the stage for additional community investment and catalyzes more revitalization projects

Tax Incentives for Preserving Historic Properties

The Federal Historic Preservation Tax Incentives program encourages private sector investment in the rehabilitation and re-use of historic buildings. It creates jobs and is one of the nation's most successful and cost-effective community revitalization programs. It has leveraged \$116.34 billion in private investment to preserve more than 47,000 historic properties since 1976. The National Park Service, through its [Technical Preservation Services](#) division, and the [Internal Revenue Service](#) administer the program in partnership with [State Historic Preservation Offices](#).

Historic Preservation Certification Application submission and review are now fully electronic. Hard copy applications are no longer accepted.

As of August 15, 2023, all applications submitted to SHPOs and materials submitted to the NPS in response to requests for additional information must be [submitted electronically](#). All applications must use the current [application forms and instructions dated "\(Rev. 6/2023\)."](#)

THE SECRETARY OF THE INTERIOR'S STANDARDS FOR THE TREATMENT OF HISTORIC PROPERTIES WITH GUIDELINES FOR PRESERVING, REHABILITATING, RESTORING & RECONSTRUCTING HISTORIC BUILDINGS

Standards for Rehabilitation

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces and spatial relationships.
2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces and spatial relationships that characterize a property will be avoided.
3. Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.
4. Changes to a property that have acquired historic significance in their own right will be retained and preserved.
5. Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.
6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.
7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.
8. Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.
9. New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work will be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.
10. New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

Ohio Historic Preservation Tax Credit Program

Community

WELCOME

HOUSING & HOMELESSNESS

ECONOMIC DEVELOPMENT

REDEVELOPMENT

GOVERNOR'S OFFICE OF APPALACHIA

The Ohio Historic Preservation Tax Credit Program provides a tax credit to leverage the private redevelopment of historic buildings. The program is highly competitive and receives applications bi-annually in March and September.

With 30 rounds of funding complete, tax credits have been approved for 627 projects to rehabilitate more than 863 historic buildings in 86 different Ohio communities. The program is projected to leverage more than \$9.09 billion in private development funding and federal tax credits directly through the rehabilitation projects.

8. Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.
9. New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work will be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.
10. New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

=

25% / 35%

Ohio Historic Preservation Tax Credit

- Annual allocation of \$120 million awarded in two competitive rounds
- Applications divided into three project sizes
 - Small Projects – Roughly \$1 million or less in Qualified Rehabilitation Expenditures
 - Intermediate Projects – Roughly \$1 million to \$10 million in Qualified Rehabilitation Expenditures
 - Large Projects – Over \$10 million in Qualified Rehabilitation Expenditures
- Percentage of allocated funds awarded to each pool, per round
 - Small Projects = 8%
 - Intermediate Projects = 25%
 - Large Projects = 67%

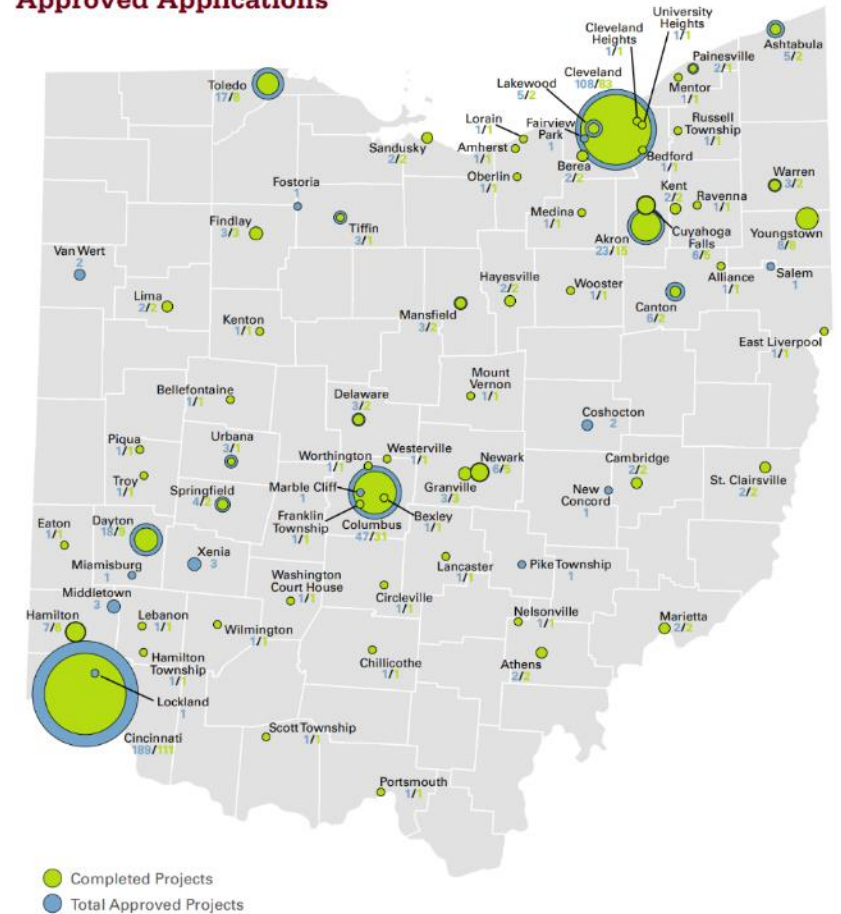

Ohio Historic Preservation Tax Credit

- Program is HIGHLY competitive, with resulting economic impact being used to score applications and determine which projects are awarded
 - Over the last three rounds, awards have totaled 39% of the credits requested
- Maximum credit request is 35% (25% in Cincinnati, Cleveland, and Columbus) and total credit per project may not exceed \$10 million
- \$120 million annual allocation (previously \$60 million), 35% maximum credit request (previously 25%), and \$10 million per project maximum credit (previously \$5 million) are tied to S.B. 225, which is effective for only state fiscal years 2023 & 2024.
- Program has had a statewide impact, with geographic distribution considered as part of scoring

Ohio Historic Preservation Tax Credit Rounds 1 to 27 Approved Applications

Ohio

Prepared for the Office of Strategic Business Investments,
Ohio Department of Development (Research December 2021)

The total number of approved projects in each location is shown by a proportionately sized blue circle and number. The number of completed projects is shown by a proportionately sized green circle and number.

Tax Exemptions: LEED-CRA

The City of Cincinnati provides incentives for developments that meet Leadership in Energy and Environmental Design Standards

LEED-CRA Tax Exemption Program (Housing Program)

The City of Cincinnati's Department of Community Development LEED Tax Abatement Program stimulates revitalization, promotes environmental awareness and low-environmental impact development, retains residents, and attracts new homeowners to the City of Cincinnati. This Program offers property tax incentives to encourage new construction and rehabilitation of residential properties to Leadership in Energy and Environmental Design ("LEED") Certified, Silver, Gold or Platinum standards.

Property tax abatement is available for buildings that meet LEED standards by promoting environmental friendliness through building construction. The program provides a benefit for residents who adopt environmentally friendly practices through 'green building' and encourages home shoppers to consider and value LEED building standards when buying within the City of Cincinnati. Homeowners and developers pay less tax and green design reduces energy costs.

Any homeowner in the City may be eligible for property tax abatement if they have renovated their home or purchased a newly constructed home that was constructed to LEED standards.

One, two, and three-unit residential structures, including condominiums are eligible for a 15 year (if newly constructed) and 10 year (if renovated) 100% tax abatement for residential buildings valued up to \$500,000 that are constructed to LEED standards within the City of Cincinnati. Homeowners will pay tax on the land. The market value limit will increase by 3% compounded each year and there is no maximum market value limit for improved property meeting the U.S. Green Building Council's "Platinum" level standards.

For more information about this program contact 352-5352.

Roofs—Cool Roofs and Green Roofs

Recommended	Not Recommended
Retaining and repairing durable, character-defining historic roofing materials in good condition.	Replacing durable, character-defining historic roofing materials in good condition with a roofing material perceived as more sustainable.
Analyzing whether a cool roof or a green roof is appropriate for the historic building.	Installing a cool roof or a green roof without considering whether it will be highly visible from the public right of way and will negatively impact the building's historic character.
Installing a cool roof or a green roof on a flat-roofed historic building where it will not be visible from the public right of way and will not negatively impact the building's historic character.	Installing a cool roof or a green roof that is incompatible in material or color with the historic building.
Selecting appropriate roofing materials and colors when putting a new cool roof on the historic building.	Adding a green roof that would be too heavy and would damage the historic building or supplementing the structural capacity of the historic building in an insensitive manner.
Ensuring that the historic building can structurally accommodate the added weight of a green roof and sensitively improving the structural capacity, if necessary.	Installing a green roof without ensuring that the roof covering is water-tight and that drainage systems function properly.
Ensuring that the roof is water-tight and that roof drains, gutters and downspouts function properly before installing a green roof.	Including a moisture-monitoring system when installing a green roof to protect the historic building from added moisture and potential leakage.
Regular basis to properly and are replaced.	Neglecting to maintain historic windows and allowing them to deteriorate beyond repair with the result that they must be replaced.
Removing repairable historic windows and replacing them with new windows for perceived improvement in energy performance.	Replacing repairable historic windows with new insulated windows.
Installing incompatible or inefficient replacement window units that are not durable, recyclable or repairable when existing windows are deteriorated beyond repair or missing.

HISTORIC
BUILDINGS

U.S. Department of the Interior
National Park Service
Technical Preservation Services

33

34

35

Recommended: [33-35] Original metal windows were appropriately repaired as part of the rehabilitation of this historic industrial building.

WINDOWS

RECOMMENDED

NOT RECOMMENDED

Retrofitting historic steel windows and curtain-wall systems to improve thermal performance without compromising their character.

Installing clear, low-emissivity (low-e) glass or film without noticeable color in historically-clear windows to reduce solar heat gain.

Installing film in a slightly lighter shade of the same color tint when replacing glazing panels on historically-dark-tinted windows to improve daylighting.

Retrofitting historically-clear windows with tinted glass or reflective coatings that will negatively impact the historic character of the building.

Introducing clear glazing or a significantly lighter colored film or tint than the original to improve daylighting when replacing historically dark-tinted windows.

36

37

38

Recommended: [36-38] Original metal windows were retained and made operable during the rehabilitation of this historic mill complex. Installing patio slider doors as interior storm windows was a creative and successful solution to improve the energy efficiency of the existing windows.

62

HEATING, VENTILATING AND AIR CONDITIONING (HVAC) AND AIR CIRCULATION

RECOMMENDED	NOT RECOMMENDED
Installing new mechanical ductwork sensitively or using a mini-duct system, so that ducts are not visible from the exterior and do not adversely impact the historic character of the interior space.	Installing new mechanical ductwork that is visible from the exterior or adversely impacts the historic character of the interior space.
Leaving interior ductwork exposed where appropriate, such as in industrial spaces, or when concealing the ductwork would destroy historic fabric.	Leaving interior ductwork exposed in highly-finished spaces where it would negatively impact the historic character of the space.
Leaving interior ductwork exposed and painting it, when concealing it would negatively impact historic fabric, such as a historic pressed metal ceiling.	Leaving exposed ductwork unpainted in finished interior spaces, such as those with a pressed metal ceiling.
Placing HVAC equipment where it will operate effectively and efficiently and be minimally visible and will not negatively impact the historic character of the building or its site.	Placing HVAC equipment in highly-visible locations on the roof or on the site where it will negatively impact the historic character of the building or its site.

63

64

65

66

Recommended: [62-63] Carefully installed new mechanical ductwork is barely visible in the elaborately decorated ceiling of this historic theater.
 [64] The ductwork has been left unpainted which is compatible with this historic industrial interior.
 [65] To avoid damaging the metal ceiling, the ductwork was left exposed and it was painted to minimize its impact, thus preserving the historic character of this former bank.

Not Recommended: [66] Interior ductwork has been inappropriately left exposed and unpainted here in this traditionally-finished school entrance hall.

SOLAR TECHNOLOGY

RECOMMENDED	NOT RECOMMENDED
Installing a low-profile solar device on the historic building so that it is not visible or only minimally visible from the public right of way: for example, on a flat roof and set back to take advantage of a parapet or other roof feature to screen solar panels from view; or on a secondary slope of a roof, out of view from the public right of way.	Installing a solar device in a prominent location on the building where it will negatively impact its historic character.
Installing a solar device on the historic building in a manner that does not damage historic roofing material or negatively impact the building's historic character and is reversible.	Installing a solar device on the historic building in a manner that damages historic roofing material or replaces it with an incompatible material and is not reversible.
	Removing historic roof features to install solar panels.
	Altering a historic, character-defining roof slope to install solar panels.
	Installing solar devices that are not reversible.
Installing solar roof panels horizontally – flat or parallel to the roof—to reduce visibility.	Placing solar roof panels vertically where they are highly visible and will negatively impact the historic character of the building.

76

77

79

Not Recommended: [79] Although installing solar panels behind a rear parking lot might be a suitable location in many cases, here the panels negatively impact the historic property on which they are located.

Recommended: [76-77] Solar panels, which also serve as awnings, were installed in secondary locations on the side and rear of this historic post office and cannot be seen from the front of the building. [78] Solar panels placed horizontally on the roof of this historic building are not visible from below.

78

WORKING WITH OHPO

Working With the Ohio State Historic Preservation Office (Ohio SHPO)

Technical Preservation Services

Works with owners of eligible historic properties in Ohio, helping them qualify for federal and state rehabilitation tax credits. Advises on the physical conservation of historic properties and conducts Building Doctor clinics for the general public. Administers the Certified Local Governments program. Serves as liaison to national and statewide historic preservation organizations. Oversees preparation of the state historic preservation plan.

**HISTORIC PRESERVATION CERTIFICATION APPLICATION
 PART 2 - DESCRIPTION OF REHABILITATION**

Instructions: This page must contain the applicant's original signature and must be signed. The National Park Service certification decision is based on the descriptions in this application form. In the event of any discrepancy between the application form and other supporting historical documents with regard to architectural goals, intended and anticipated uses, approved and anticipated uses, the application form takes precedence. A copy of this form will be provided to the National Business Service.

NPS Project Number

1. **Historic Property Name** Baker Brothers Wholesale Grocery

Street: 8-12 East Main Street
 City: Zanesville County: Washington State: OH Zip: 43704

Name of Historic District or National Register property: Baker Brothers Wholesale Grocery

2. **Project Data** (For phased projects, data entered in this section must be totals for entire project)

Date of survey: [redacted] Estimated total rehabilitation costs (GFA): [redacted]
 Number of buildings in project: [redacted] Floor area before / after rehabilitation: [redacted] sq ft
 Start date (anticipated): [redacted] (date) before / after rehabilitation: [redacted]
 Completion date (anticipated): [redacted] Number of housing units before / after rehabilitation: [redacted]
 Anticipated number of phases: [redacted] of [redacted] phases Number of low/moderate income housing units before / after rehabilitation: [redacted]

3. **Project Contact** (if different from applicant)

Name: [redacted] Signature: [redacted]
 Title: [redacted] City: [redacted] State: [redacted]
 Zip: [redacted] Telephone: [redacted] Email address: [redacted]

4. **Applicant**

I hereby affirm that the information I have provided is, to the best of my knowledge, correct. I further affirm that (check one or both boxes, as applicable):

I am the owner of the above-described property within the meaning of "owner" set forth in 36 CFR § 57.22311, and/or

I am not the owner of the above-described property, but I am the single named owner of the above-described property and I am acting in relation to this application and have my signature, as well as a written statement from the owner, a copy of which is attached to this application form and accompanied forms, or has been previously submitted, and I consent to the requirements of 36 CFR § 57.22311.

For purposes of this statement, the signature shall include the person's name. Applicant I understand that retaining an architect or other professional firm in the application may subject me to fines and imprisonment under 18 U.S.C. § 1001, which, under certain circumstances, provides for life

Name: [redacted] Signature: [redacted]
 Title: [redacted] City: [redacted] State: [redacted]
 Zip: [redacted] Telephone: [redacted] Email address: [redacted]

Applicant, owner, or title has changed since previously submitted application

NPS Official Use Only

The National Park Service has reviewed the Historic Preservation Certification Application - Part 2 for the above named property and has:

the rehabilitation described herein is consistent with the historic character of the property and, where applicable, with the extent to which the Secretary of the Interior's Standards for Rehabilitation. This entry is a preliminary determination only. A final certified only to the owner of a "historic historic character" who shall submit work to complete.

the rehabilitation or proposed rehabilitation will meet the Secretary of the Interior's Standards for Rehabilitation if the attached condition

the rehabilitation described herein is not consistent with the historic character of the property or the district in which it is located and the Secretary of the Interior's Standards for Rehabilitation.

Date: National Park Service Authorized Signature
 NPS conditions or comments attached

Rec'd by SHPO Aug 31 2023
**HISTORIC PRESERVATION CERTIFICATION APPLICATION
 PART 2 - DESCRIPTION OF REHABILITATION**

Historic Property Name: Baker Brothers Wholesale Grocery NPS Project Number:

Property Address: 8-12 East Main Street, Zanesville, OH
 National Determination:

Aside from the masonry cleaning described above, no other work is proposed.

Number 7 Feature Storefront Date of Feature 1894, 1978

Describe existing feature and its condition:
 The 1894 building has a traditional three-bay storefront, with a flush center entrance flanked by cast iron columns and large display windows. The storefront sits on a metal sill plate supported by sandstone blocks. The aluminum door assembly - with vertical sidelight and transom - is not historic (date unknown). Above the door and windows are single glazed transoms. Storefront framing, window trim, and bulkheads are wood. One of the plate glass windows has been pierced/cracked and temporarily secured with plywood both appear to be historic, if not original. At the northeast corner of the building is a single storefront bay, with the same configuration and materials as described above.

The 1913 building was built to complement the design of the original building, but the storefront was replaced in 1978 when the building was renovated for a furniture store showroom. The historic storefront originally aligned with the dimensions of the 1894 building, in terms of its proportions and scale. While photos of the original storefront could not be located for this project, it appears from physical evidence that two display windows were removed from the historic storefront, the transom and bulkhead areas were infilled with brick, and the current insulated, aluminum-framed display windows were installed in the new openings. A diamond-shaped window - also insulated with aluminum framing - was added at the front end of the west wall of the 1913 building, providing additional illumination to the showroom space at street level.

Photo Number: Drawing Number: A1.3, A1.7

Describe work to feature:
 Historic interior trim will be carefully removed, existing single-pane glazing will be removed, and new aluminum-clad, single-lite wood display windows will be installed in the 1894 storefront. Original wood trim will be reinstated, with adjustments for the new glazing as needed. Window samples will be submitted to the SHPO for review and approval before work begins, as stipulated in Item 10 below.

No changes are proposed for the 1913 storefront.

Number 8 Feature Loading dock (east) Date of Feature 1894, unknown

Describe existing feature and its condition:
 There are 2 freight doors and 1 pedestrian door on the east wall of the 1894 building. Directly in front of the doors is a 3-bay loading dock, whose deliveries were initially made to/from the grocery warehouse. The loading dock is wood framed, with plywood decking and skirting. Access to the platform is provided by a precast concrete stair at the north end of the loading dock. While it does not appear to be historic, the age of the platform cannot be determined. It is in poor condition.

Above the platform are 5 wood knee braces that are cantilevered out of pockets in the

Qualified Rehabilitation Expenditures

Certified Rehabilitation

Certified Historic Structure

Depreciable

Substantial

Phased Project

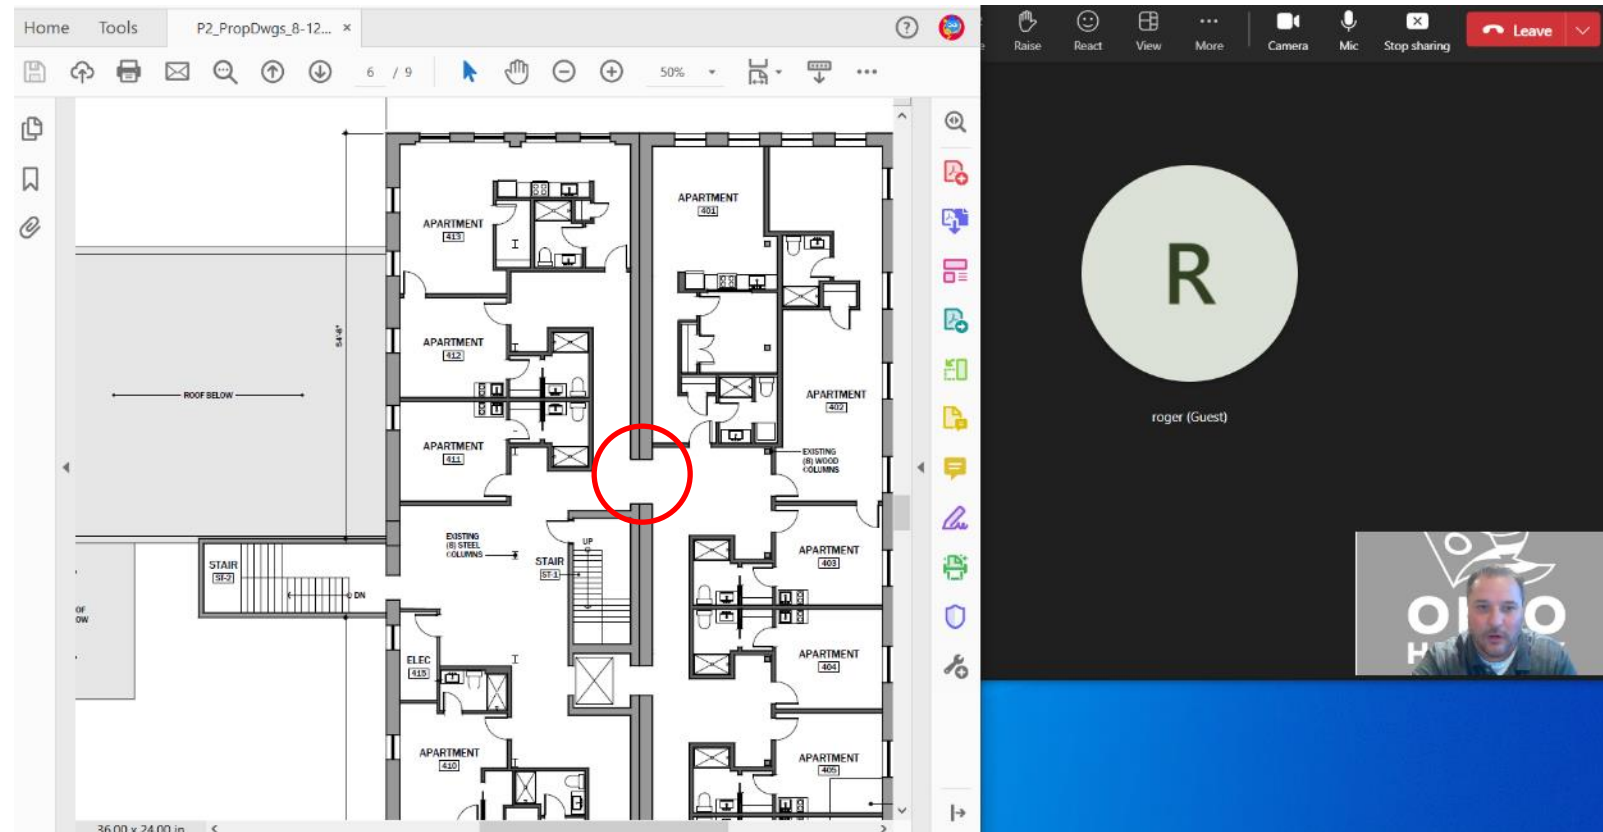

Placed in Service Date

These expenditures include costs associated with the work undertaken on the historic building, as well as architectural and engineering fees, site survey fees, legal expenses, development fees, and other construction-related costs if such costs are added to the basis of the property and are determined to be reasonable and related to the services performed. They do not include costs of acquiring or furnishing the building, new additions that expand the existing building, new building construction, or parking lots, sidewalks, landscaping, or other facilities related to the building.

All application materials are now submitted ELECTRONICALLY

Open Lines of COMMUNICATION

- Always accessible via phone/email
- Regularly participate in videoconferences with architects, consultants, and applicants to discuss challenging issues
- Able to conduct site visits to gain a better understanding of the building

SHPO is part of the project **TEAM**

We want your project to **SUCCEED**

- Helps return a historic building to productive use
- Promotes further investment in the surrounding neighborhood.

Stearns & Foster Company Office Building
100 Williams Street, Lockland, Ohio
Items for consideration to qualify for Historic Tax Credits

Introduction

This report is based on a site visit to the Stearns & Foster Company Office Building on Monday, January 11, 2021, with Jerry Noble of Pepper Construction and others. The purpose of the report is to advise on design and construction issues that may arise in meeting the Secretary of the Interior's Standards for Rehabilitation, which must be followed to qualify for state and federal tax credits for Historic Rehabilitation. (The Standards for Rehabilitation are provided on page 7 of this report.) While the Standards can be challenging to interpret when applied in specific situations, they can be distilled down to a single principle, which is that historically significant building fabric and spaces must be retained, if feasible, and if replaced, they must be duplicated to preserve the historic appearance of the building.

Brief History of the Building

The Stearns & Foster Company Office Building is associated with what was a major industry in Lockland, Ohio for almost a century. Founded in 1846, the company was initially based in Cincinnati and built its first factory in Lockland in 1882. By 1898, the company moved its entire operation to Lockland and remained in business there until 1993. Its factory buildings occupied several blocks north of Wyoming Avenue, but today only the office building remains.

The office building was built in at least three stages, beginning with the "C"-shaped section facing Williams Street in 1912. Sometime later an "L" shaped addition was added on the rear, and a third addition was made at the northeast corner. The phases of construction are very evident in the aerial photo below based on the parapet outlines. Because the building was built at different times, there are differences in structure, materials, finishes, and window configuration throughout.

Advice on Meeting the Standards

Masonry - The exterior masonry is consistently variegated red-purple brick in Flemish style. Slight variations are visible in the joints and brick color. Repointing must be carried out only so as to match existing in appearance, color, texture, tooling, profile and

Material - There is a terra cotta cornice as well as a plaque above the door announcing the name of the company. Both must be retained and repaired and/or repointed, similar to existing masonry.

View of Office Building on Williams Avenue, looking northeast

There is a small bronze plaque to the right of the main entrance, which should be

retained. The exterior doors are replacements, such as the main entrance double metal fire doors on the south and east. However, there is one original wood door on East Wyoming Avenue with 8 lights in the top. This should be retained. The windows are an assortment of windows, most are original with wood double-hung windows. On the 12 wing, the second floor features paired windows with 4-over-4 wood sashes. The first floor has 6-over-6 wood sashes. These have been protected by storm windows and appear to be in sufficiently good condition. There are no windows on the third floor of the second addition. Unless it can be determined the windows are beyond repair, it will be expected that they will be replaced. Energy efficiency can be provided by weatherstripping, storm windows. A complete window survey is required to identify all the conditions and

SULLEBARGER ASSOCIATES HISTORIC PRESERVATION CONSULTANTS

Brick Garage - Located to the east of the Office Building, the brick garage dates from 1912 and its construction is similar, with corner quoins and dentil molding at the cornice. The garage is in good condition, with a new roof. The garage bays retain multi-light wood transoms, but the original doors are missing. A door stored in the garage appears to be a later retrofit. Install new doors.

Interior High performance storms (emersion to provide) (CMTA to analyze energy modeling) Assumes fur-out of exterior walls. If no furring, need to explore slim profile storm windows. Decision of furring comes down to budget, thermal & energy benefit. What is the energy impact of each wall, what is the cost shifting potential with each option? Targeting 0.15 but might change to 0.4. Both infiltration rates are being assessed in Wall evaluations.
Window	U-0.35 / SHGC-0.37		emersion	CMTA	Met: _____	2/19/2021 Comments: A3 Analysis, Option 1 accepted. Repair plaster and utilize plaster finish as primary air barrier. 30 EUI is dependent on the Alpen Winsert Plus as interior storm window option for better thermal leakage reduction. Locate interior storm to be sealed to the plaster because the plaster is the primary air barrier. 30 EUI is dependent on using the plaster as the air barrier throughout the entire building.
Building Envelope Infiltration	< 0.15 CFM ₅₀ /ft ²		emersion	CMTA	Met: _____	2/19/2021 Comments: A3 Analysis, Option 1 accepted. Repair plaster and utilize plaster finish as primary air barrier.
Air Barrier Permeance	> 30 perm vapor diffusion		emersion	CMTA	Met: _____	
ENERGY PERFORMANCE						
Baseline EUI	85 kBTU/sf/yr					
SITE PREDICTED EUI	30 kBTU/sf/yr	65% Reduction	CMTA	emersion	Met: _____	Maximum Bldg EUI to achieve Net Zero Goal with on-site PV Array offset
Gas Usage vs. Electrification Balance	All Electric, No Gas		CMTA		Met: _____	Building EUI will be more around 30.
Renewables	PV Array		CMTA	emersion	Met: _____	220,000 kWh / year required, plus a little bit more to offset degradation of panels 93-94 kW of Solar Canopy w/ 103 kW of Rooftop Solar. Roof edge 4' offset, roof hatch 4' offset around. 240 panels, but need to finalize vendor. Around 5,000 SF of solar canopy. Pricing based on Option 1 # of panels. What is needed from a production for solar. Assumption 430 Watt panel assumed in calcs. Confident to be around 30 EUI.
INDOOR AIR QUALITY PERFORMANCE						
Temperature	Monitored		CMTA		Met: _____	
Humidity	Not Applicable / Not Pursued		CMTA		Met: _____	
Carbon Dioxide (CO2)	< 900 ppm		CMTA		Met: _____	CO2 monitors in conference rooms. Monitoring yes. Monitoring return CO2 systems. Enverid system. Monitoring at Building Level. Enverid input level. Not used for demand control ventilation. Mostly a monitoring point. CO2 monitoring needs recalibration every couple years. Each monitor is ~\$300/monitor last 3-5 yrs (CMTA). What is integration into controls system?
Carbon Monoxide (CO)	< 9 ppm		CMTA		Met: _____	LEED increases the ventilation load requirements beyond ASHRAE.
Formaldehyde	< 50 µg/m3		CMTA		Met: _____	Explore for optimization (< 6 ppm)
Ozone (O3)	< 51 ppb		CMTA		Met: _____	Explore for optimization (< 25 µg/m3), Drives lifecycle for Enverid
Particulate Matter 2.5 (PM2.5)	< 15 µg/m3		CMTA		Met: _____	Explore for optimization (< 25 ppb); Reason to replace Enverid filters
Particulate Matter 10 (PM10)	< 50 µg/m3		CMTA		Met: _____	
Radon	< 0.15 Bq/L (4 pCi/L)		CMTA		Met: _____	Typically not an issue because outside air is brought in and exhausted. Still need to test for to understand where we are at baseline. Specific for ground floor. Zip code indicates low risk from Hamilton County Radon maps. Enverid does not treat this.
Total Volatile Organic Compounds (TVOC)	< 500 µg/m3		CMTA		Met: _____	
INDOOR ENVIRONMENTAL QUALITY PERFORMANCE						
Private Offices, Conference Rooms, Classrooms	< 40 dBA		emersion		Met: _____	SHPO conversation done. Need conversations around acoustic control.
Open Office, Common Areas	< 50 dBA		emersion		Met: _____	Explore pink noise as potential noise mitigation strategy
Exterior Noise Intrusion	< 60 dBA		emersion		Met: _____	
Reverberation Time (RT60)	0.6 seconds (based on room type)		emersion		Met: _____	Need to run acoustics strategies and credits to ground
Lighting Requirements	Consider BIOS where applicable		emersion	CMTA	Met: _____	
Daylighting - Spatial Daylight Autonomy	sDA _{100/50%} @75% Annual Hours		emersion	CMTA	Met: _____	Average sDA 300,50% is achieved for 75% of regularly occupied floor area
Daylighting - Direct Solar	ASE _{200,230} Annual Sunlight Exposure		emersion	CMTA	Met: _____	Annual sunlight exposure is no more than 10%
Lighting - Light Levels	150 EML		CMTA	emersion	Met: _____	
Lighting - Light Quality	CRI 90 + R9 > 50		emersion	CMTA	Met: _____	
MATERIALS PERFORMANCE

BENCHMARKS

WHERE DO WE NEED TO BE?

Energy

76
National Average

15
2030 Target

EUI is expressed as energy per square foot per year. It is calculated by dividing the total energy consumed by the building in one year (measured in kBtu) by the total floor area of the building. The most common unit for EUI is kBtu/ft²/year.

55%
Daylight

Spatial Daylight Autonomy (sDA) describes the percentage of floor area that receives at least 300 lux for at least 50% of the annual occupied hours.

10%
Glare

Annual Solar Exposure (ASE) refers to the percentage of space that receives too much direct sunlight (1000 Lux or more for at least 250 occupied hours per year), which can cause glare or increased cooling loads.

Baseline Energy

Benchmarking Energy

Whole Building EUI Breakdown

Cooling

Your cooling load is not dominating your energy use. This is because your HDD are higher than your CDD days.

Heating

Your heating load is dominating your energy use. This is because your HDD are higher than your CDD days. You can reduce your heating load by facade, HVAC system or reducing infiltration.

Lighting

Your lighting load contributes to 11.39% of the total EUI. You can reduce your lighting load by reducing your lighting power density and having daylight and occupancy sensors in the Engineering Inputs.

Equipment

Your equipment load contributes to 10.78% of the total EUI. You can reduce your equipment load by reducing your appliance power density in the Engineering Inputs.

Hot Water

Your hot water load contributes to 2.43% of the total EUI. You can reduce your hot water load by reducing your domestic hot water demand and using a more efficient hot water generation system in Engineering Inputs.

Fans

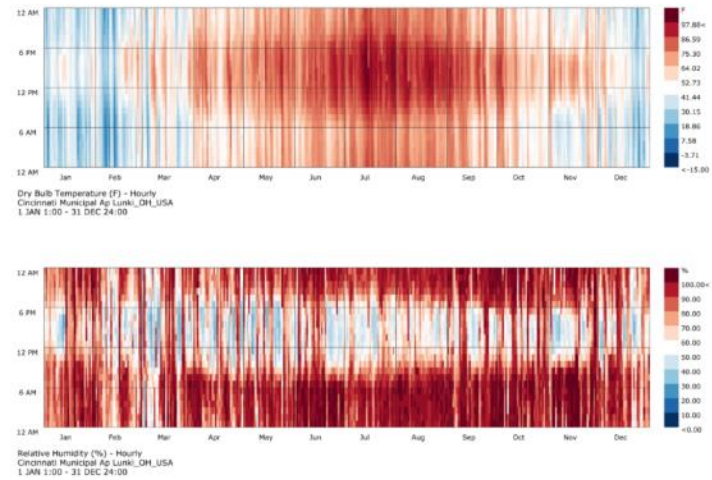

Your fan load contributes to 9.42% of the total EUI. You can reduce your fan energy by switching your fan flow control accordingly in the Engineering Inputs.

Pumps

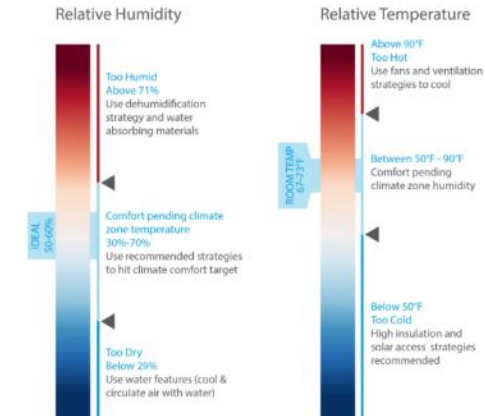

Your pump load contributes to 0.29% of the total EUI. You can reduce your pump energy by adjusting pump control for cooling/heating in the Engineering Inputs.

CLIMATE ANALYSIS

RELATIVE TEMPERATURE & HUMIDITY

This graph shows the outdoor comfort in Lockland using the yearly range of temperatures and humidities.

CLIMATE ANALYSIS

RADIATION BY SKY SEGMENT

This graph maps the radiation onto a sky dome to show the intensity of the direction and intensity of solar radiation on a yearly basis around the cardinal points for Lockland.

CLIMATE ANALYSIS

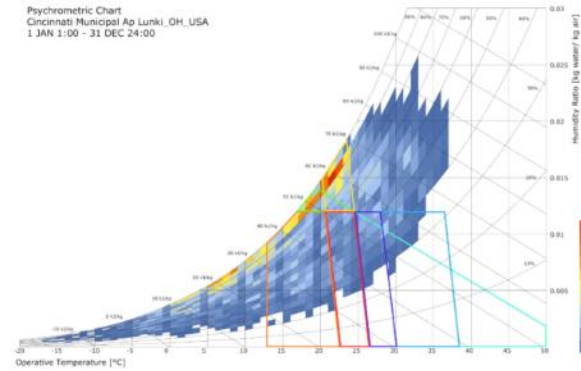

RADIATION BENEFIT

Total Radiation(kBTU/ft2)
Cincinnati Municipal Ap Lunke, OH, USA
1 JAN 1:00 - 31 DEC 24:00

CLIMATE ANALYSIS

PSYCHROMETRIC CHART

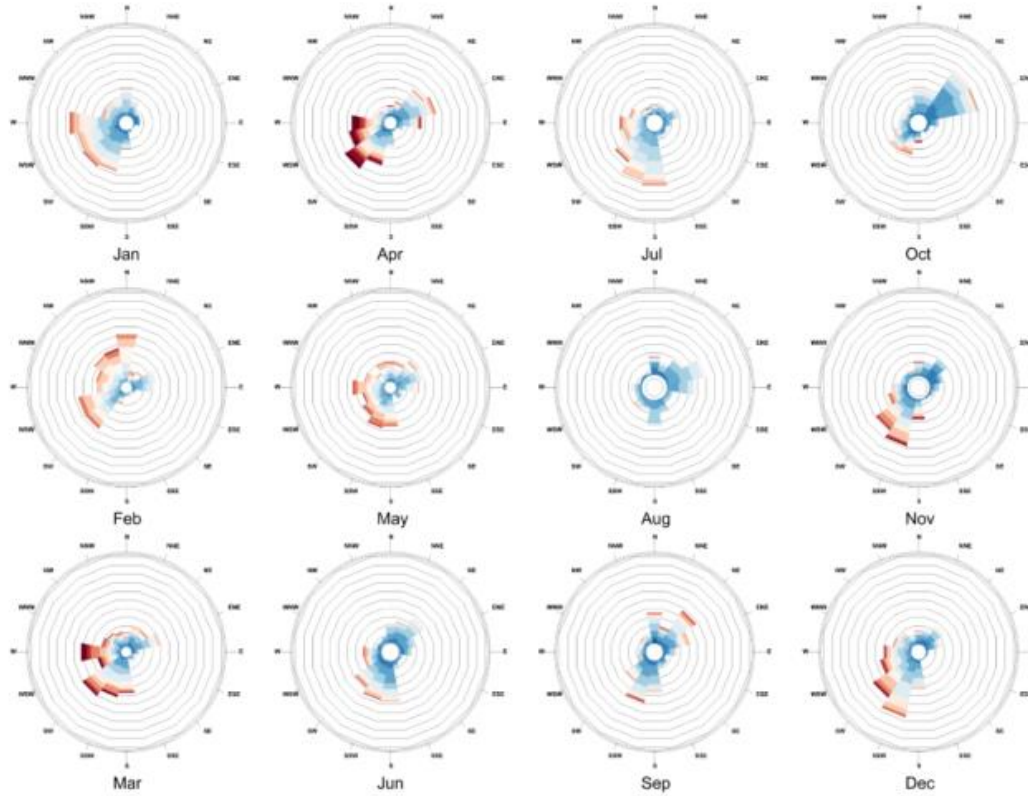

Strategy	Impact
COMFORT - NO PASSIVE STRATEGIES	3.89%
EVAPORATIVE COOLING	1.93%
THERMAL MASS + NIGHT VENTILATION	2.18%
OCCUPANT USE OF FANS	2.05%
INTERNAL HEAT GAIN	21.53%
DESICCANT DEHUMIDIFICATION	5.02%
DEHUMIDIFICATION	8.81%

This chart shows the relationship between dry bulb, humidity ratio, and enthalpy. The polygons overlaid on the chart represent different strategies to increase comfort. Based on ASHRAE 55-2013 under standard conditions.

CLIMATE ANALYSIS

WIND

The diagrams show the wind direction and intensity coming to the site. The number of hours are reflected by the size of the rose, and the intensity is expressed in colors as shown in the legend.

Understanding the Wind Diagram

Using this graph one can identify a climate zone's prevailing winds. Knowing ones prevailing winds can help identify best building facades to use for passive ventilation strategies such as operable window placement.

Low Wind Speeds
Ventilation placed along the directions of 'low wind speeds' or 'winds of minor reach' will not be effective in cooling dominant areas (Hot/ Tropical Climates)

Mild Wind Speeds

High Wind Speeds
High wind with the furthest reach is the prevailing wind for that climate area. This is the best area/ direction for ventilation strategy.
