

# Why Embodied Carbon Matters, and What You Should Do About It

Daniel Overbey, AIA, NCARB, LEED Fellow, WELL AP, EcoDistricts AP

REBUILD 2021

October 7, 2021

**BALL STATE**  
UNIVERSITY

# Meet Your Speaker

## Daniel Overbey, AIA

NCARB, LEED Fellow, WELL AP, EcoDistricts AP

Assistant Professor, Ball State University

Director of Sustainability, Browning Day

**BALL STATE**  
UNIVERSITY

# Learning Objectives: 1.0 AIA CE Hour

**Learning Objective 1:** Participants will be able to define embodied carbon and its basic metrics.

**Learning Objective 2:** Participants will be able to explain the different stages of lifecycle assessment (LCA) and why they matter to embodied carbon data.

**Learning Objective 3:** Participants will be able to describe ways of gauging and optimizing projects for lower embodied carbon as part of a building design workflow.

**Learning Objective 4:** Participants will be able to identify ways in which embodied carbon metrics are becoming integral to green building rating systems.

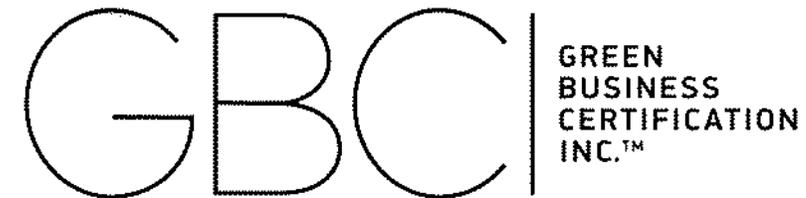

# Learning Objectives: 1.0 GBCI LU (BD+C Specific)

**Learning Objective 1:** Define embodied carbon and understand its basic characteristics and metrics.

**Learning Objective 2:** Explain a workflow to optimize a project for minimal embodied carbon in accordance with the LEED v4 BD+C Building Life-Cycle Impact Reduction credit.

**Learning Objective 3:** Describe how LEED v4 BD+C can assist in gauging and optimizing building products and materials through disclosure documents such as environmental product declarations (EPDs).

**Learning Objective 4:** Identify ways in which embodied carbon metrics are becoming integral to LEED v4 BD+C as part an Integrative Process.

**Part 1: Global context on carbon emissions**

**Part 2: Defining embodied carbon for buildings**

**Part 3: Modeling and measuring embodied carbon**

**Part 4: Role of building product disclosures**

**Part 5: Gauging total carbon intensity**

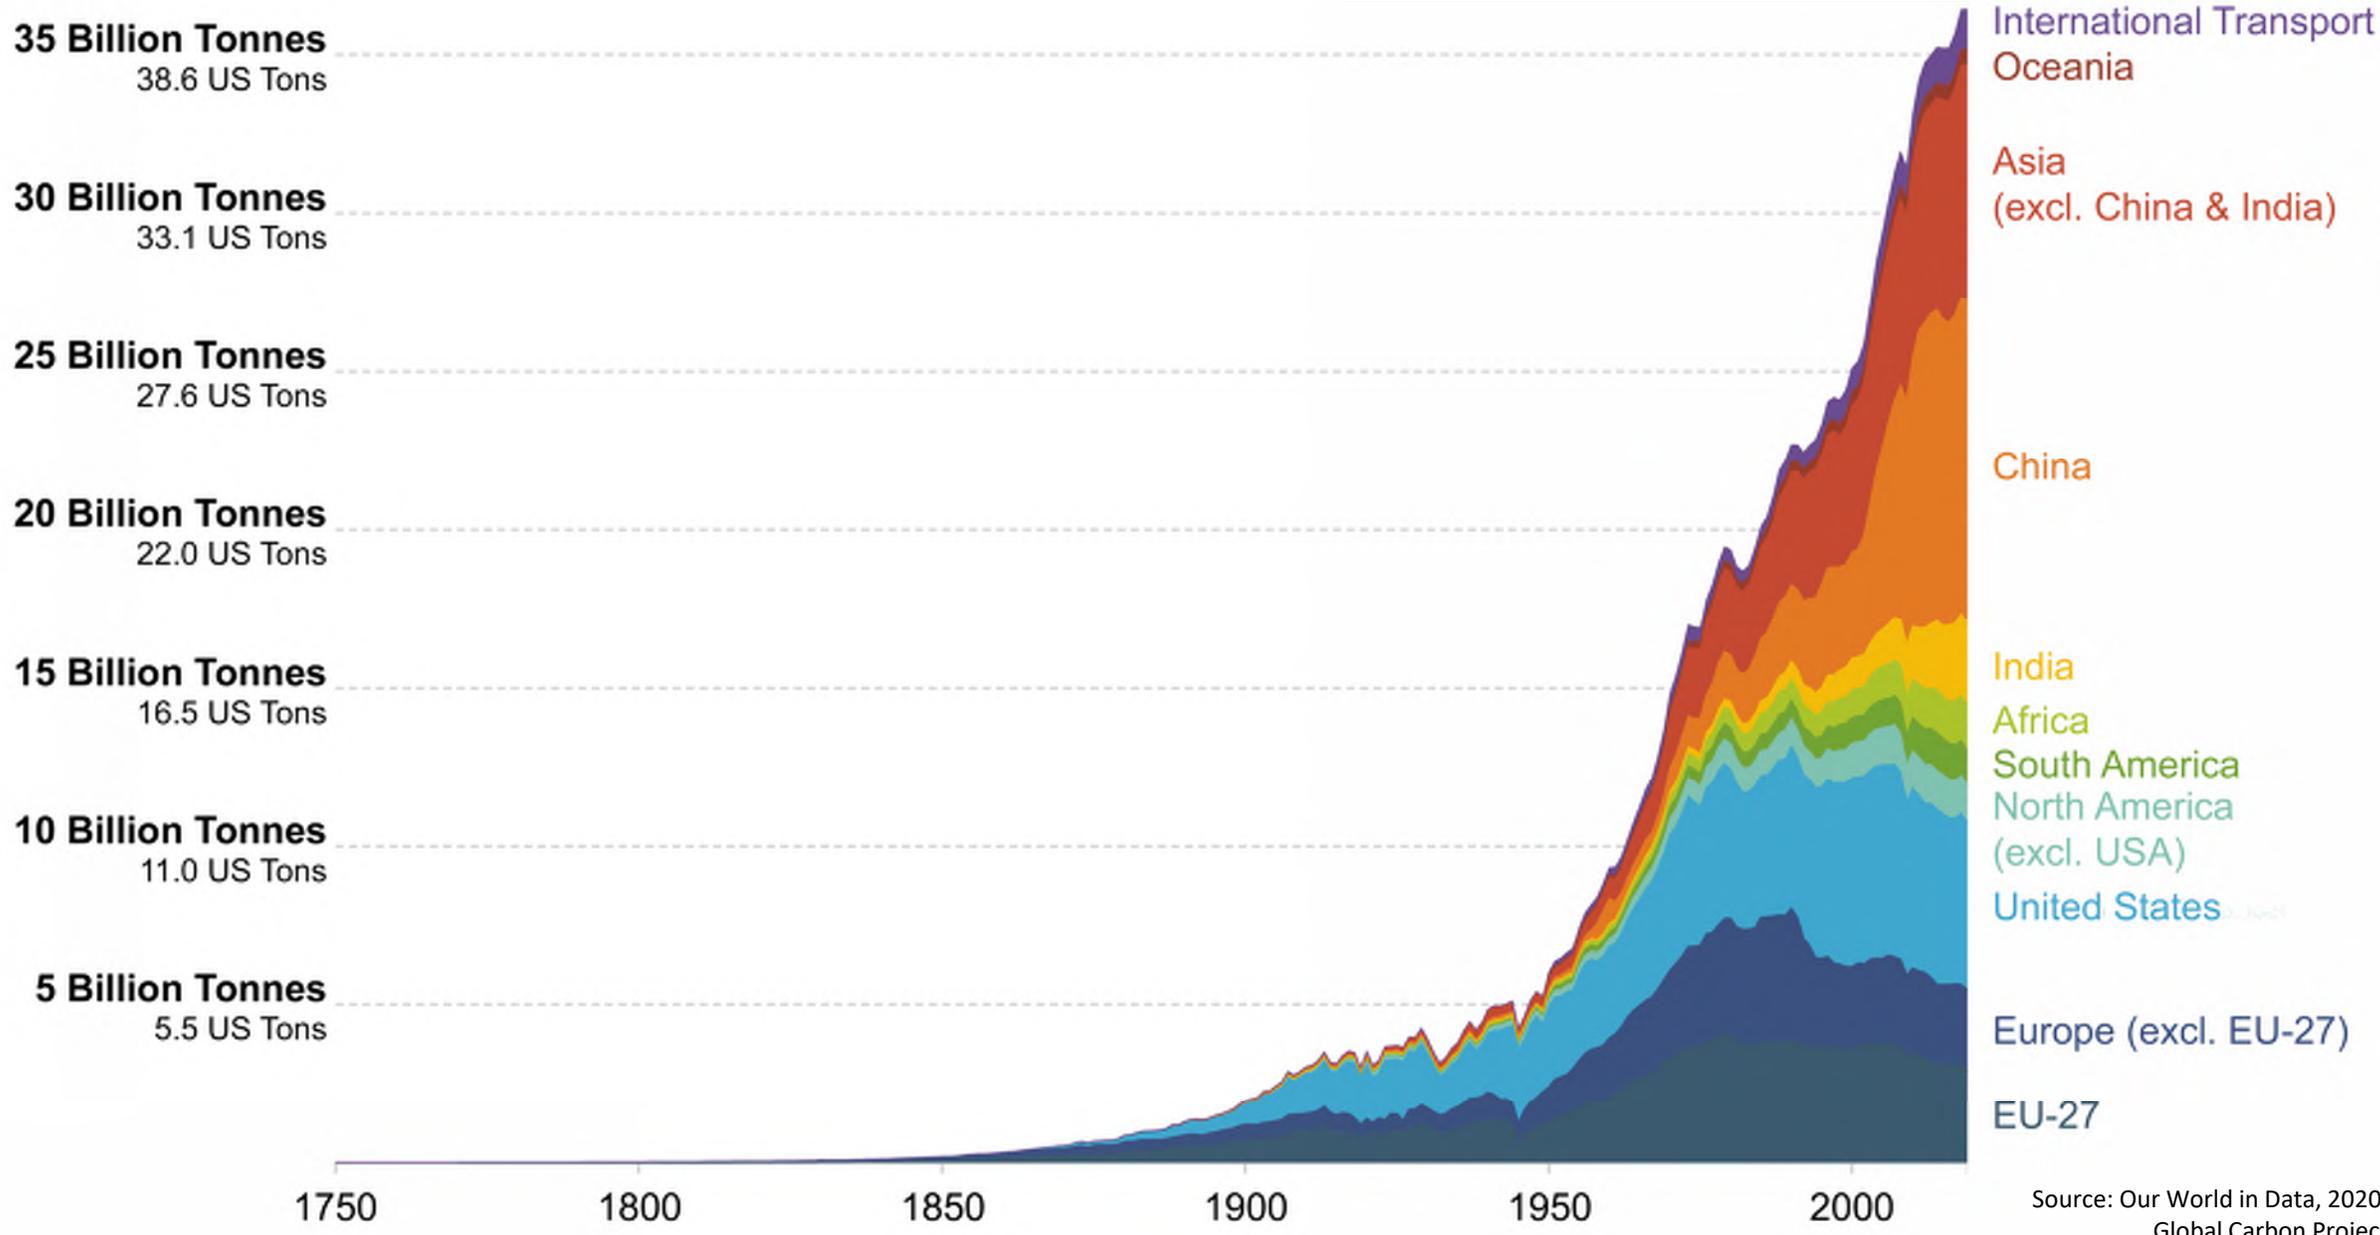

**Global context on carbon emissions**

**1**

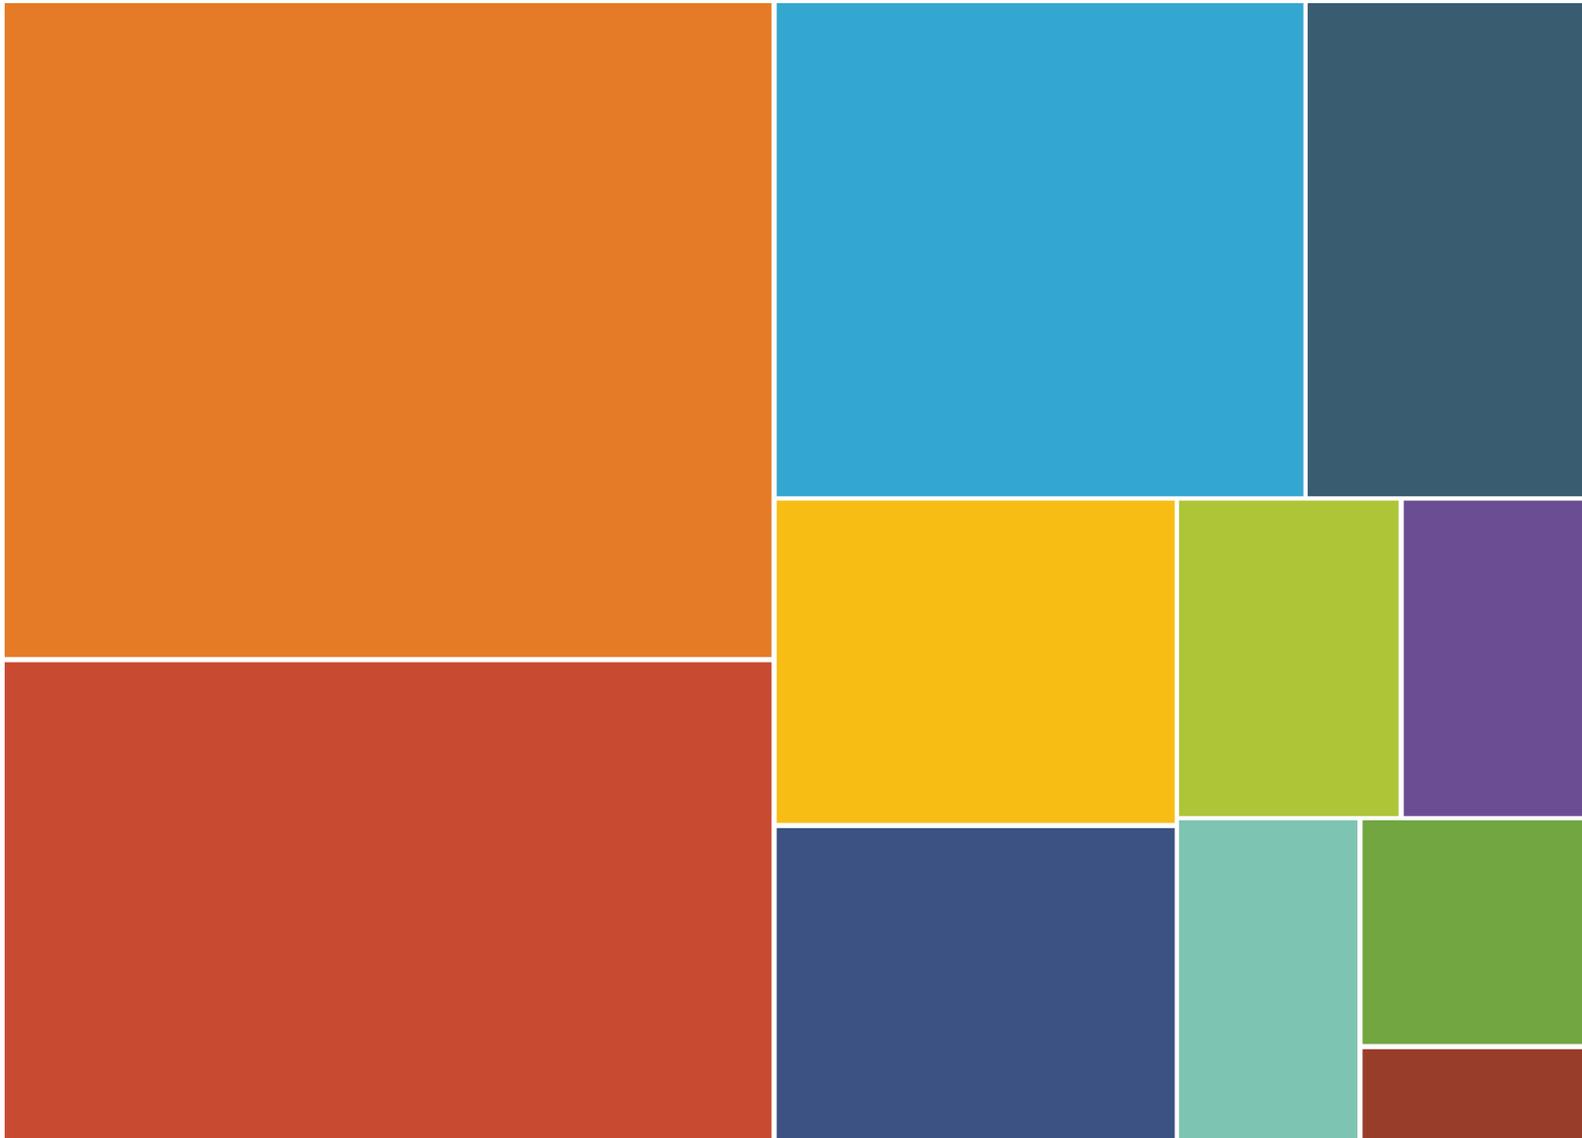

**The world is on a carbon binge.**

2019: 36.42 Billion Tonnes CO<sub>2</sub>e

**36.42 Billion Tonnes CO2 / Year**

Source: Our World in Data, 2020;  
Global Carbon Project

# Global CO2 Emissions by Sector

**4.0 Billion Tonnes**  
of annual global carbon emissions  
come from embodied carbon

**Projected average annual new construction globally:  
65.98 Billion SF / year = 4.0 Billion Tonnes of CO<sub>2</sub>**

Let us take a closer look at U.S. figures.

Operational  
carbon:  
**1.48 B**  
Tonnes CO2

Embodied  
carbon:  
**0.58 B**  
Tonnes CO2

Global Carbon Projection: U.S. = **5.28 Billion Tonnes CO2 (2019)**

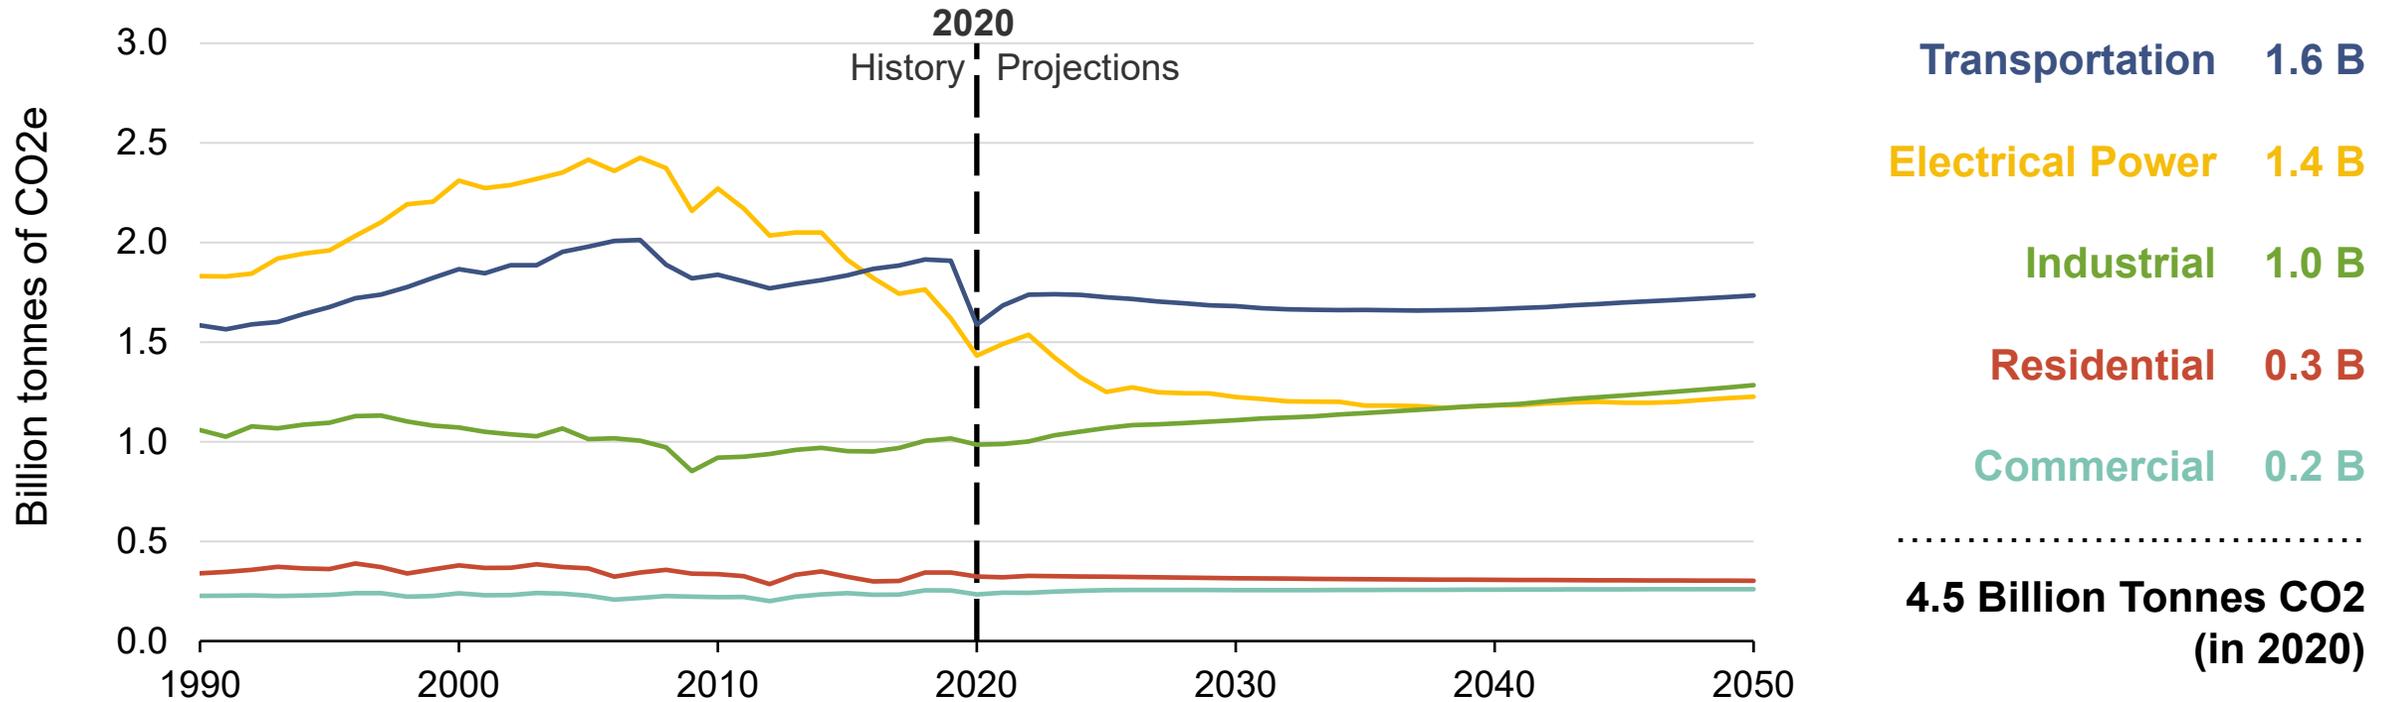

# U.S. Energy-Related CO2 Emissions

Energy-related carbon dioxide emissions

EIA AEO2021 reference case

Global Carbon Project:  
US = 5.28 Billion Tonnes (2019)

Energy Information Administration:  
US = 5.09 Billion Tonnes (2019)

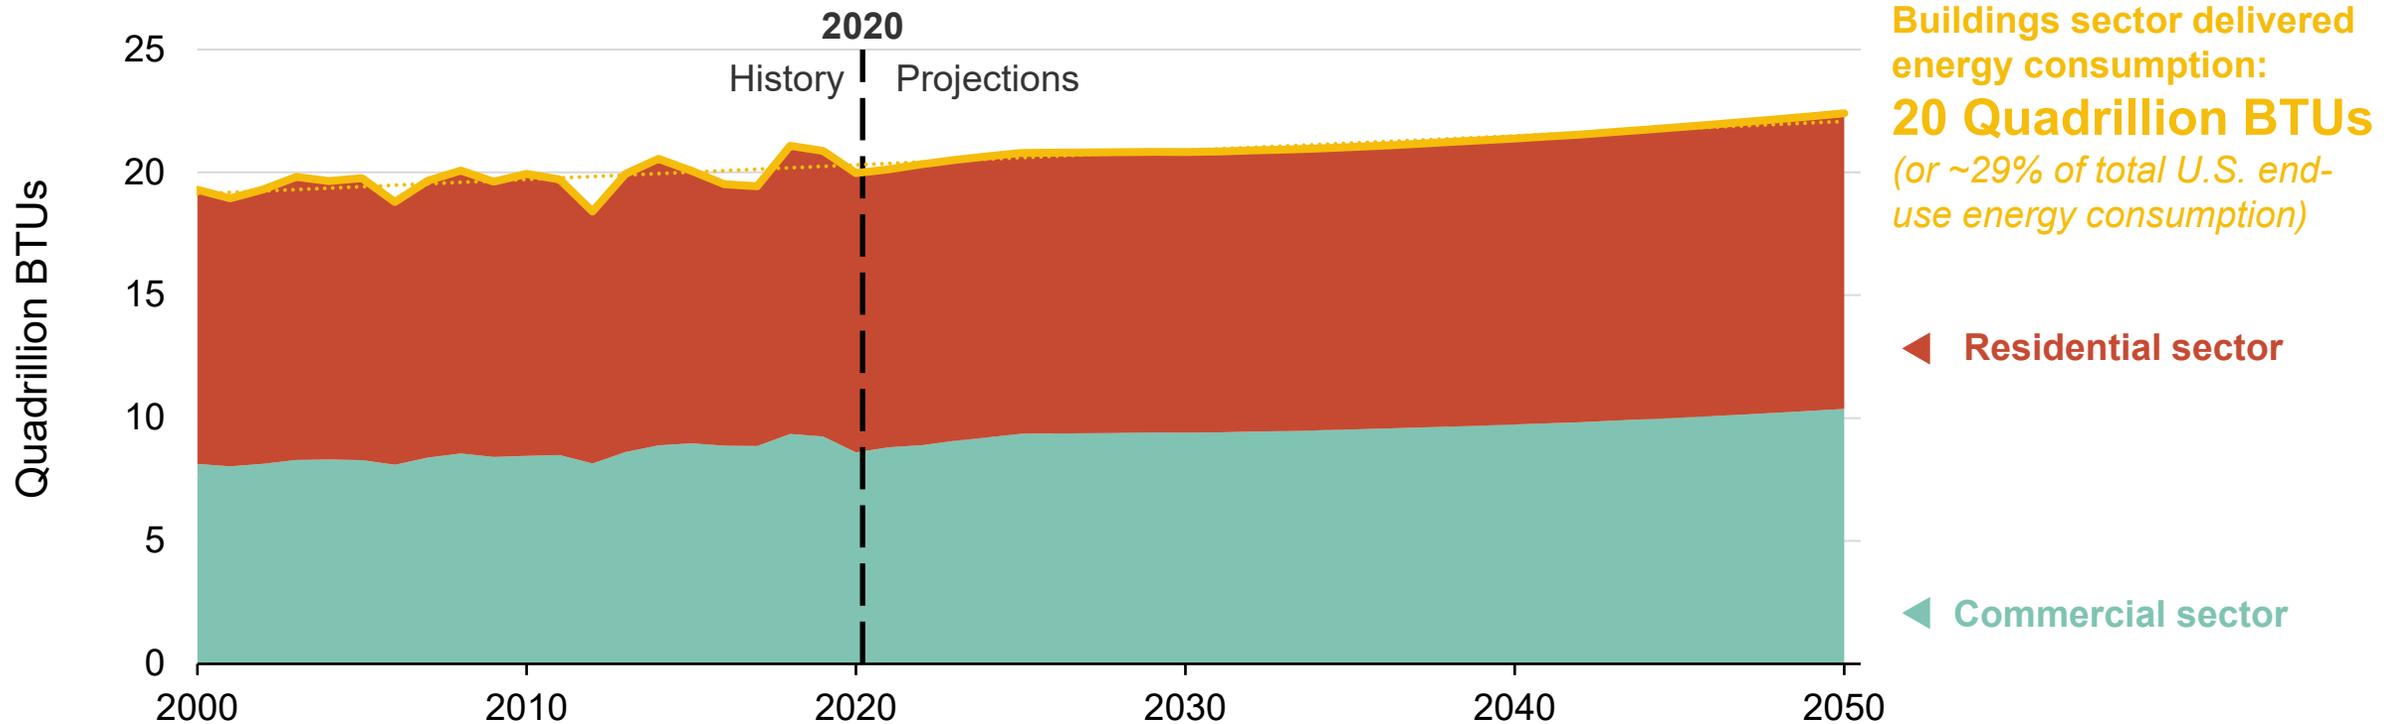

Source: U.S. Energy Information Administration

# U.S. Buildings Sector Delivered Energy Consumption

## Buildings delivered energy consumptions

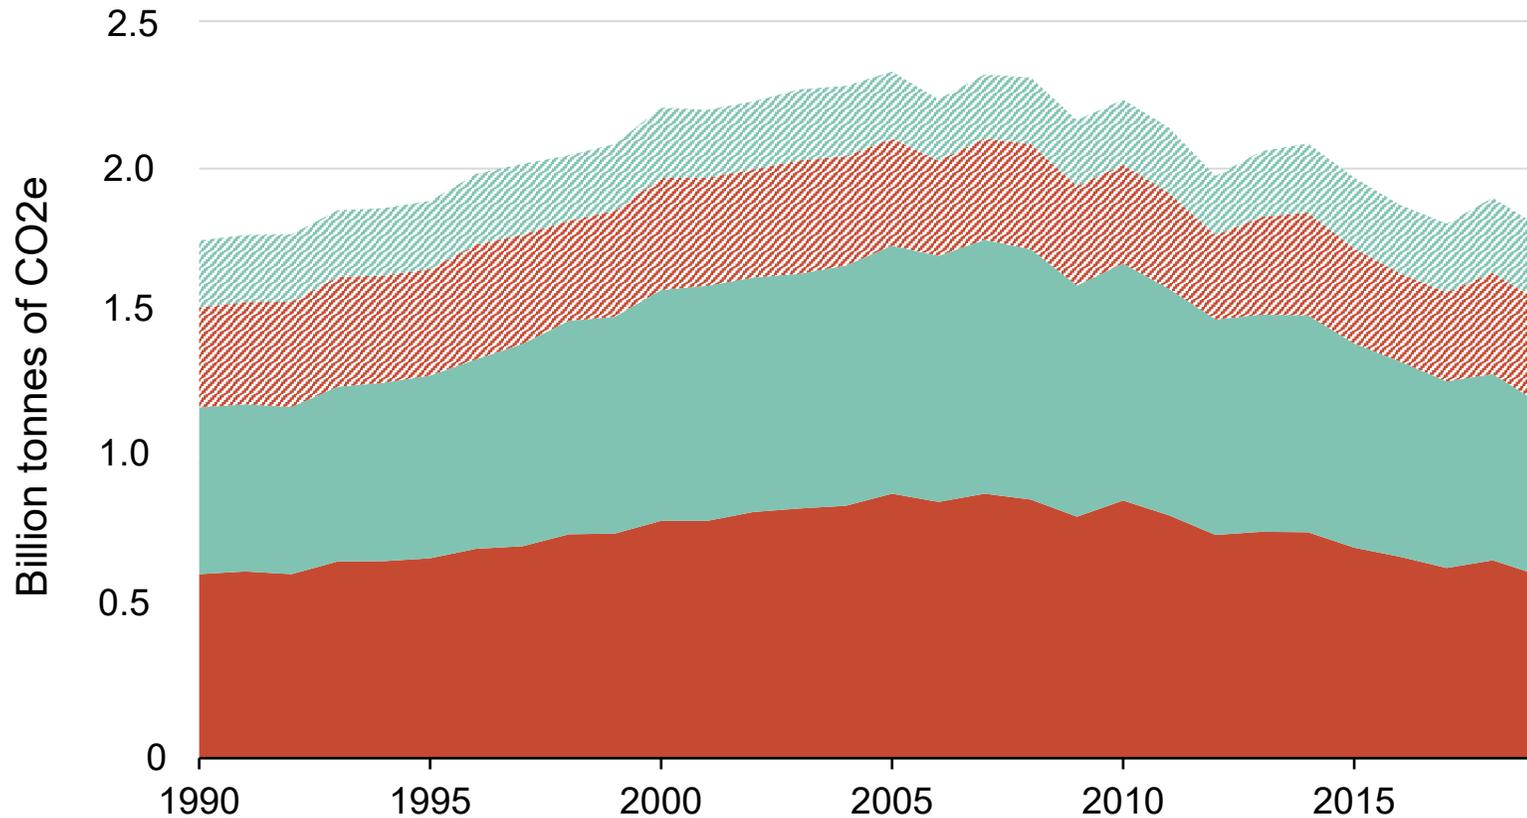

EIA AEO2021 reference case

Source: U.S. Energy Information Administration

# U.S. Buildings Sector Energy-Related CO2 Emission

Historic data: 1990-2019

In 2019, the buildings sector accounted for approximately

**35%** of U.S. carbon emissions.

Commercial Direct Use 0.25 B

Residential Direct Use 0.34 B

Commercial Purchased Elec. 0.59 B

Residential Purchased Elec. 0.62 B

**1.80 Billion Tonnes CO2 (2019)**  
(vs. 1.48 Billion via Global Carbon Project)

Source: U.S. Energy Information Administration

**Defining embodied carbon  
for buildings**

**2**

**Scope**

**Stages**

# Define the Scope

**The scope can make a huge difference in the total embodied carbon figures.**

When it comes to defining embodied carbon on a building project, design teams should clarify the scope of the assessment. Which of the following does the scope include?

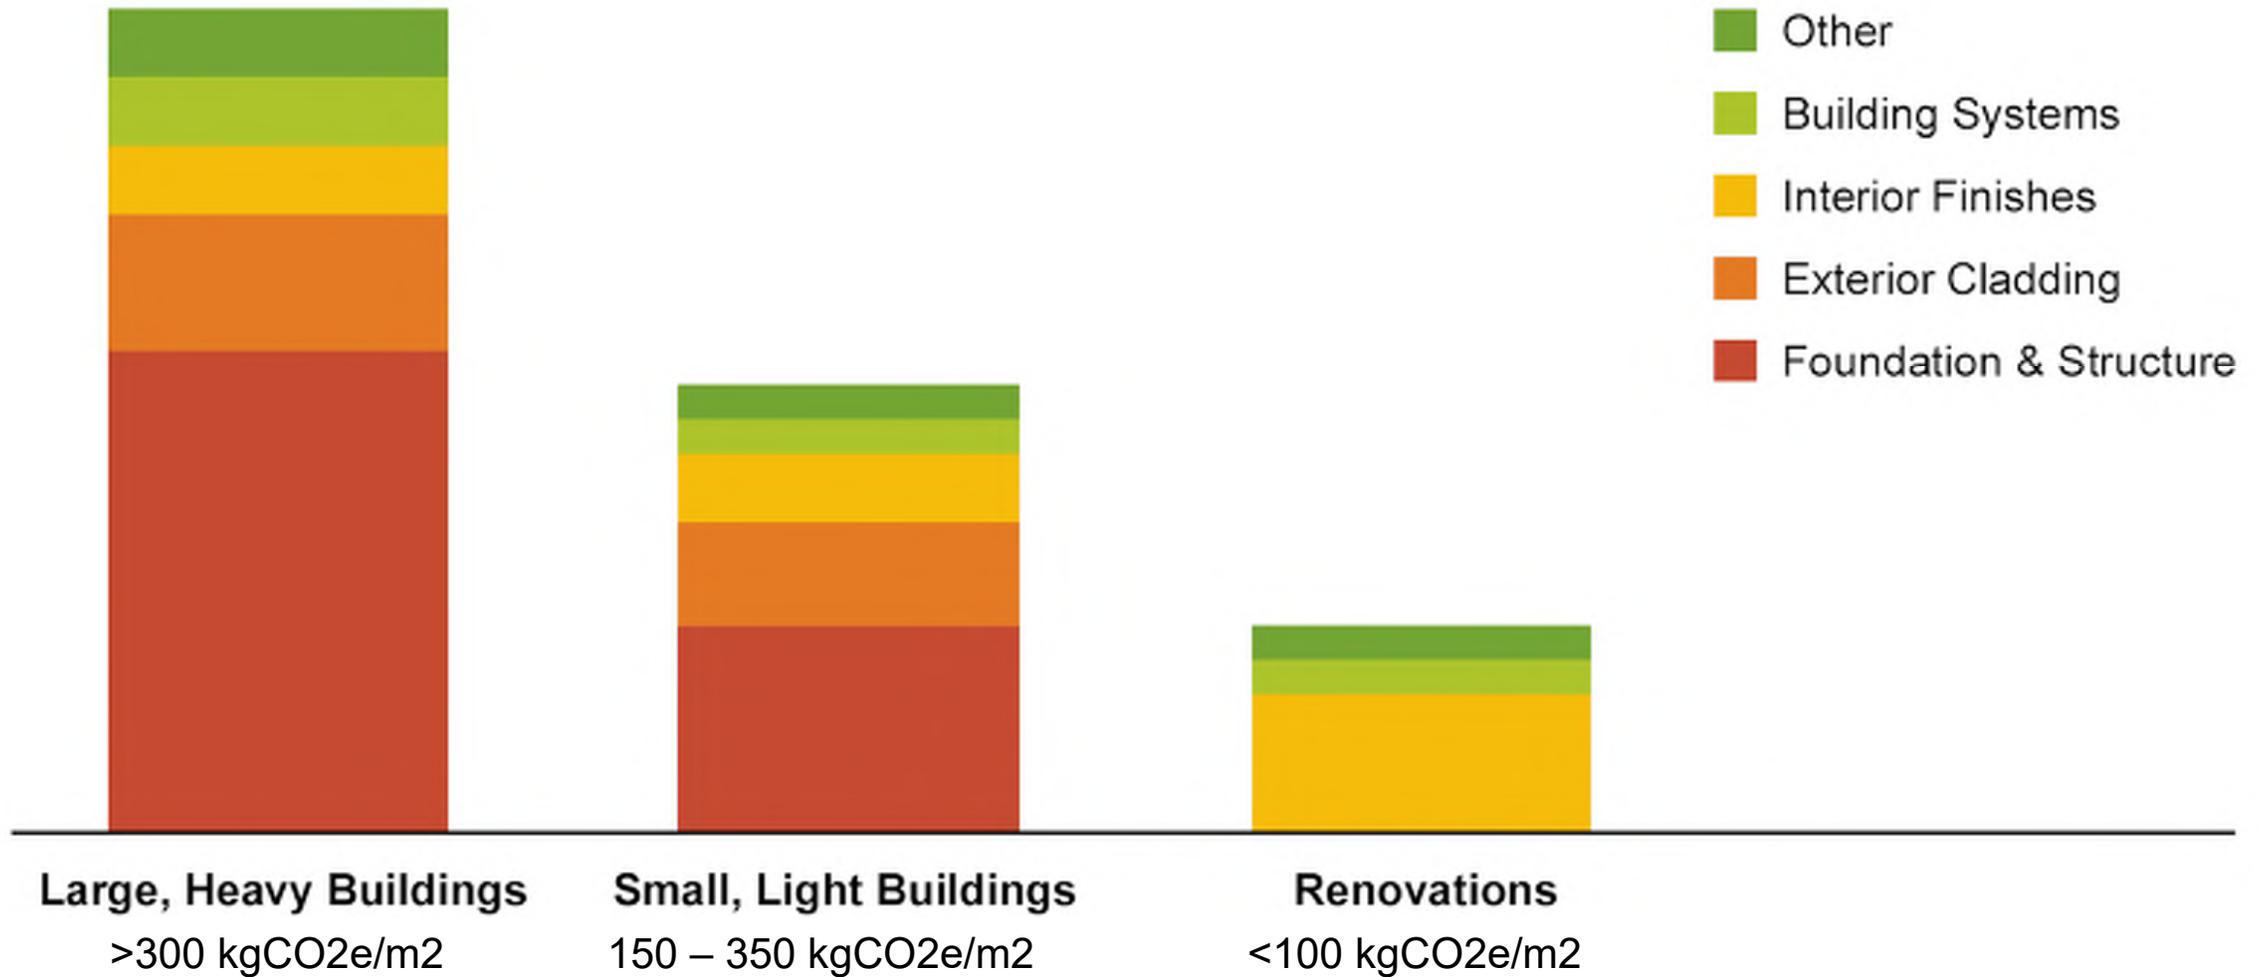

- Substructure
- Superstructure
- Enclosure
- Interiors
- Others (e.g. mechanical systems)

A new multi-story commercial building is going to be responsible for much more embodied carbon than a renovation project of the same magnitude.

The LEED Gold IU Eskenazi Museum renovation reused over 95% of the existing walls, floor, and roof components. Image source: Indiana University

# Carbon Emissions by Building Type and Materials

Adapted from: Larry Strain, "Time Value of Carbon" (2017)

Source: Browning Day

# Define the Stages

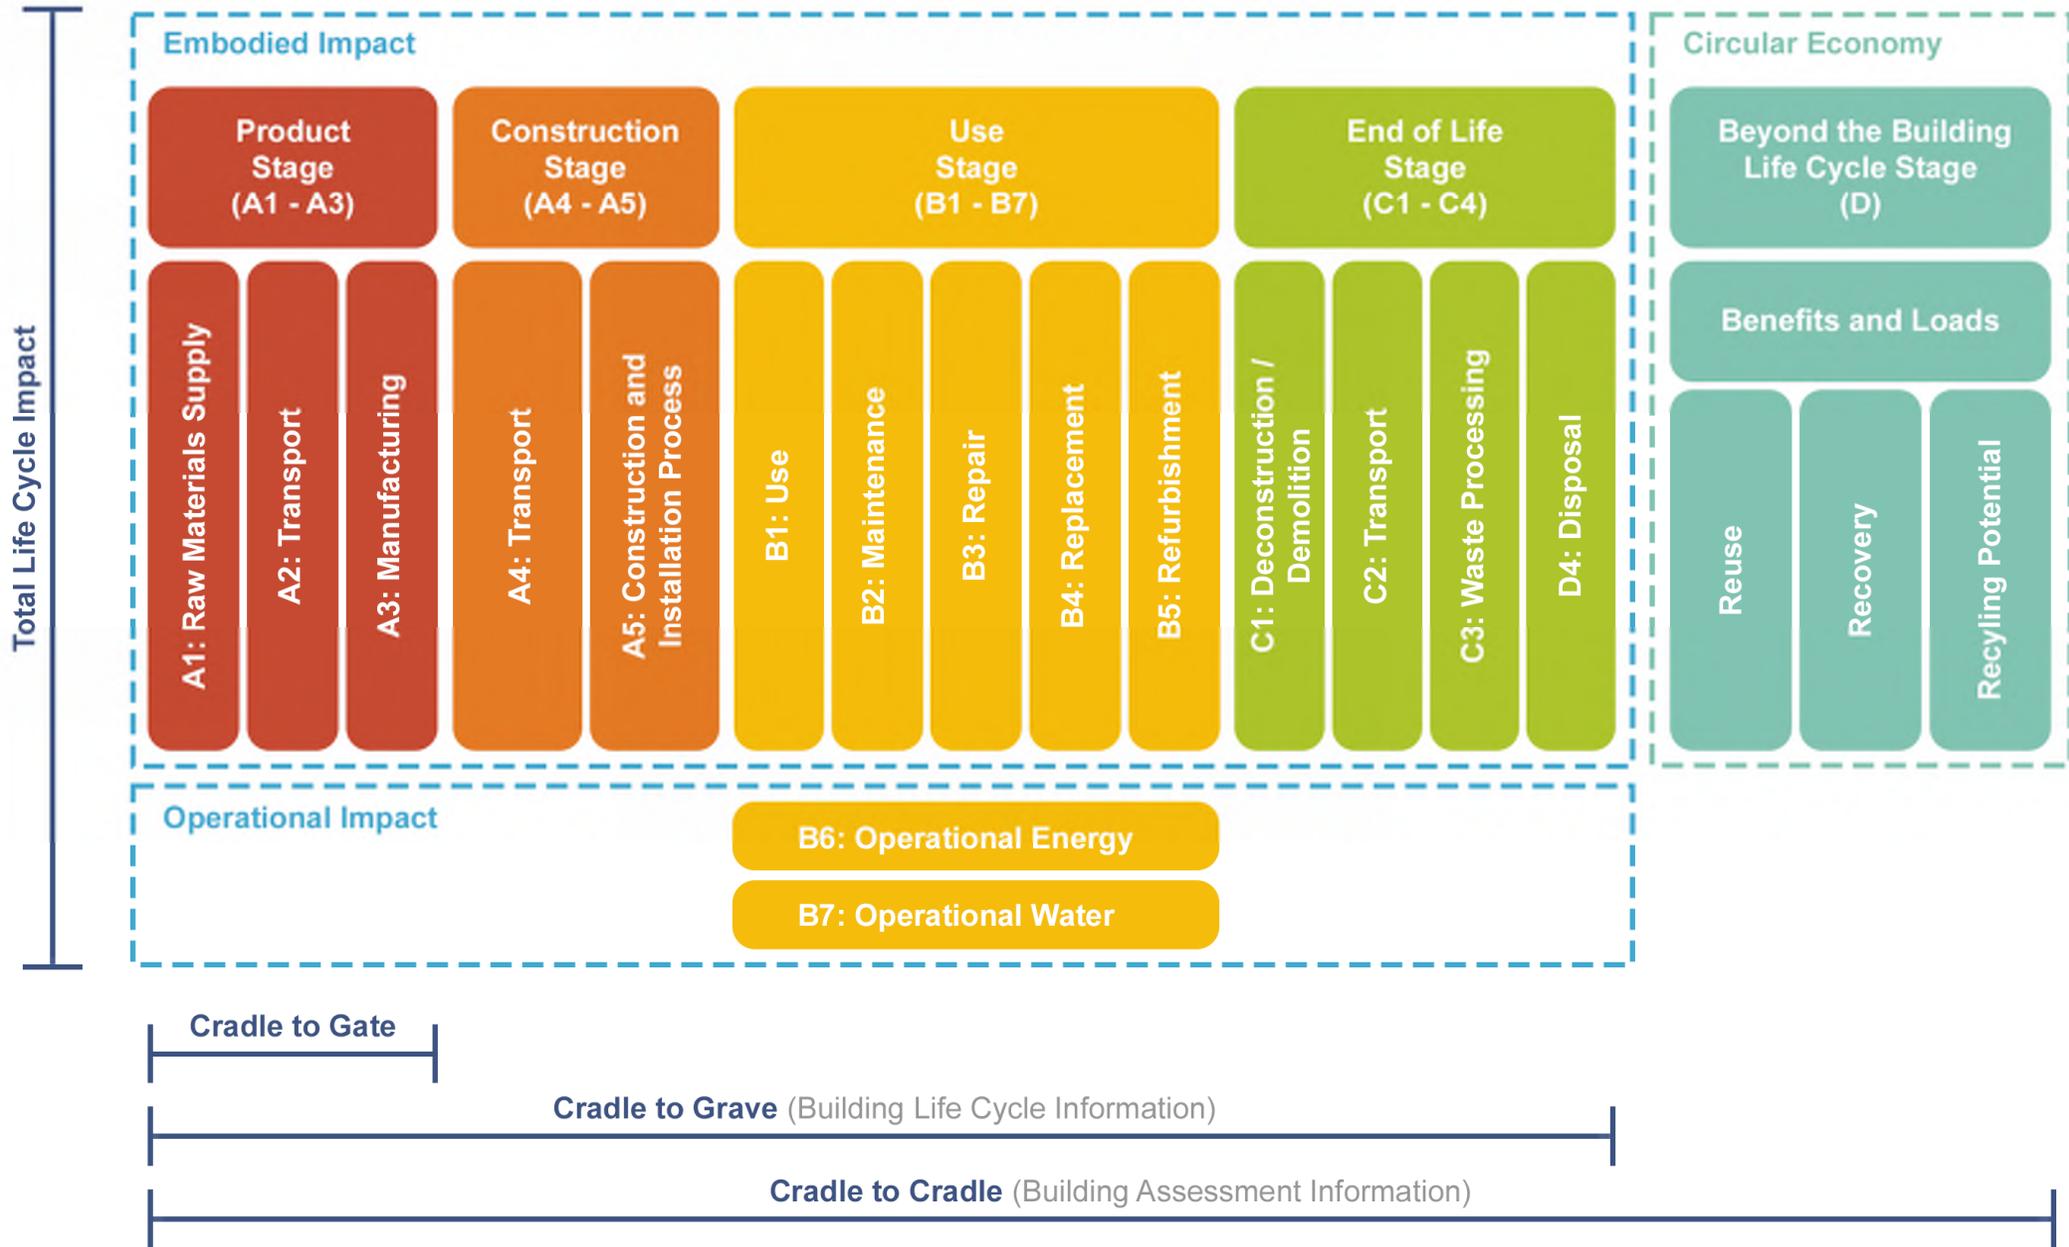

**Not all lifecycle assessments cover the same stages.**

Standard EN 15978:2011: *Sustainability of construction works - Assessment of environmental performance of buildings - Calculation method* was developed by the European Committee for Standardization (CEN).

This document defines a calculation method, based on LCA and other quantified environmental information, to assess the environmental performance of a building.

# Embodied vs Cumulative Operational Carbon Impact by Year

Embodied carbon figures only account for the building's structure and envelope.  
Figure assumes the same average energy consumption every year.  
Maintenance not included.

Source: Browning Day

# IUPUI Innovation Hall

Our embodied carbon data painted an incomplete picture.

1. Embodied carbon only accounts for structure and exterior cladding.
2. Interior fit out and mechanical systems likely to be renovated over time.
3. Operational carbon does not account for the greening of the utility grid.

Source: IUPUI

**Modeling and measuring  
embodied carbon**

**3**

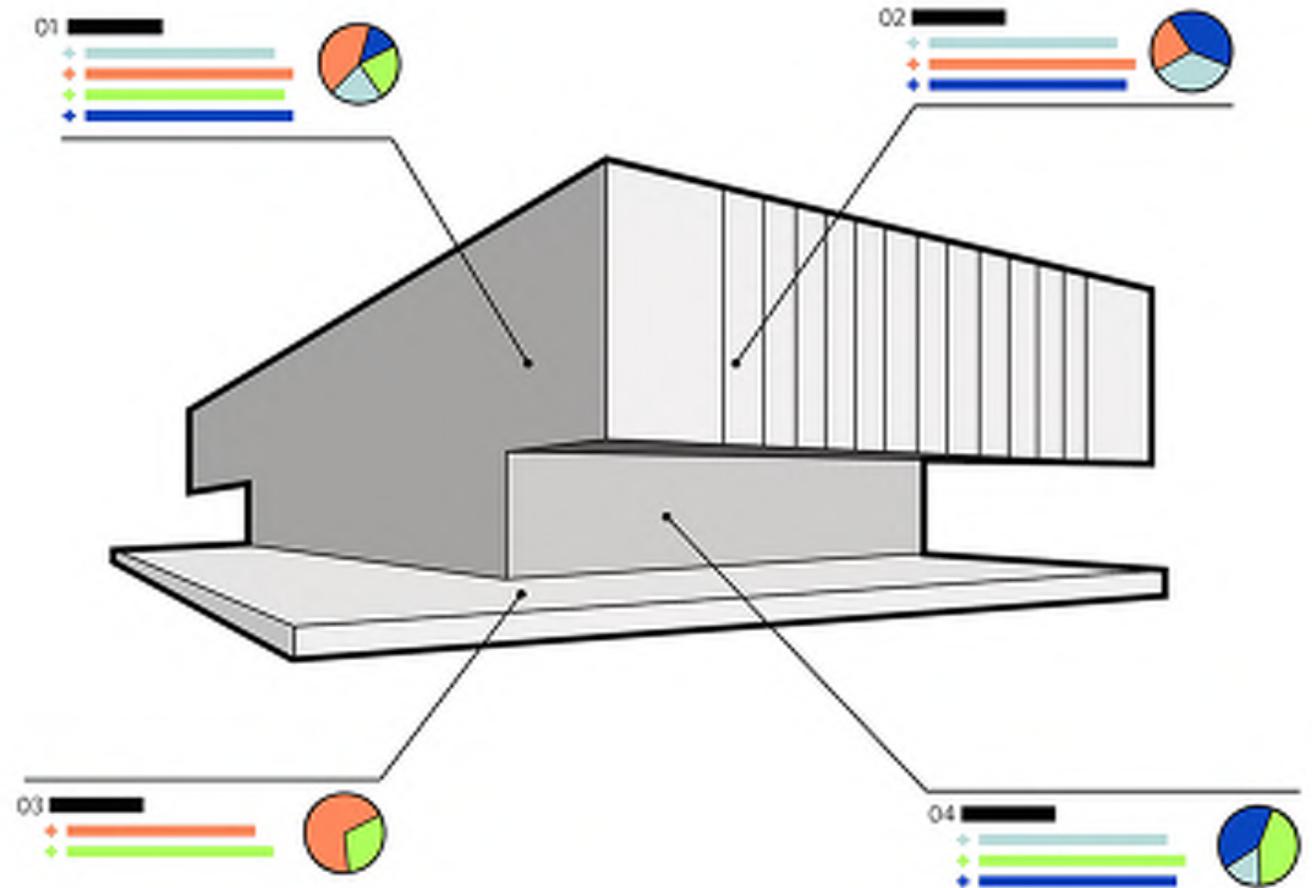

# Modeling and Measuring Embodied Carbon

We can now leverage building information modeling (BIM) and other modeling tools to conduct environmental impact assessments on whole buildings.

These tools tap into industry-wide datasets.

The [AIA Design Data Exchange \(DDx\)](#) now allows [2030 Commitment](#) signatories to record and track embodied carbon figures from the following tools:

- Athena
- Tally
- EC3
- OneClick LCA
- eTool

Source: Kieran Timberlake

# LEED and Embodied Carbon

## LEED v4 BD+C: Building life-cycle impact reduction

### Option 4. whole-building life-cycle assessment (3 points)

For new construction (buildings or portions of buildings), conduct a life-cycle assessment of the project's structure and enclosure that demonstrates **a minimum of 10% reduction**, compared with a baseline building, in at least three of the six impact categories listed below, one of which must be **global warming potential**.

No impact category assessed as part of the life-cycle assessment may increase by more than 5% compared with the baseline building.

Under **LEED v4.1 BD+C** project teams can get 1 point just for running the LCA model (to encourage more modeling).

# Case Study: IPL Eagle Branch Library

# Case Study

## IPL Eagle Branch Library

Indianapolis, Indiana

Gross area: 18,663 sf.

Branch of the Indianapolis Public Library.

LEED v4 Gold certified.

50% energy improvement over baseline.

Energy-efficiency with on-site renewable energy combined for a predicted energy cost savings of over 80%.

Envelope and structure were optimized to reduce the building's embodied carbon by over 15%.

Through efficient fixtures and fittings, the Eagle Branch reduced indoor water consumption by nearly 35%.

Nearly 63% of construction waste was diverted from landfill.

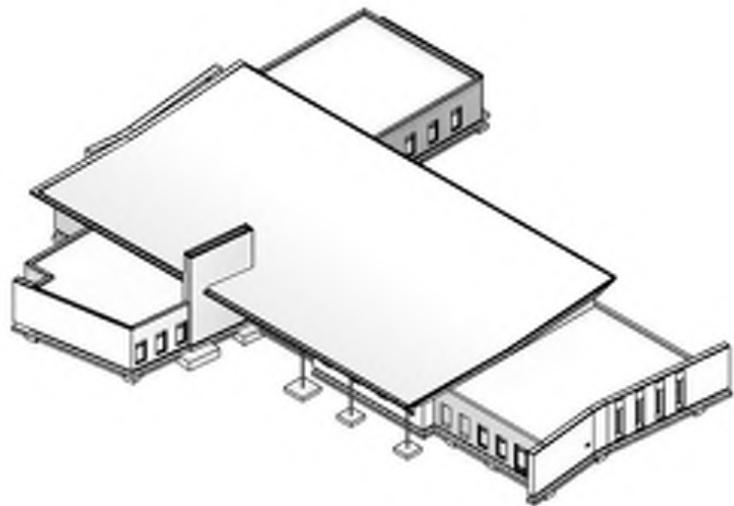

Operational

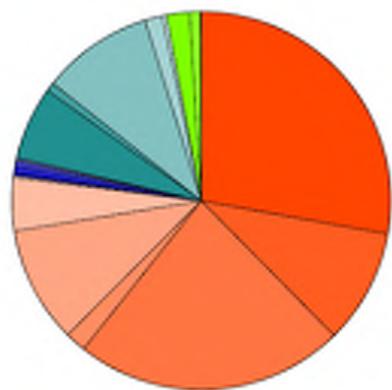

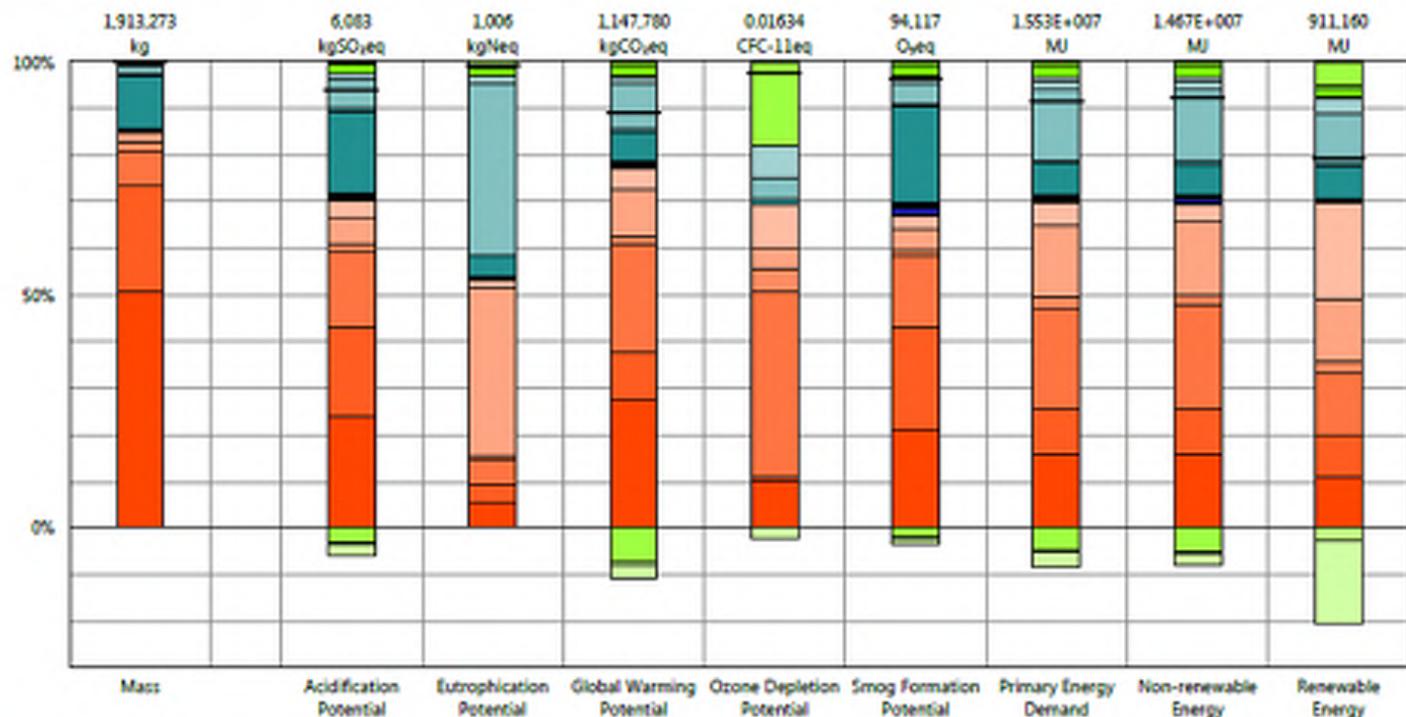

kgCO<sub>2</sub>e/m<sup>2</sup>  
year

# Life-Cycle Assessment: Baseline vs Proposed

Source: Browning Day

# IPL Eagle Branch Library

Baseline embodied carbon:

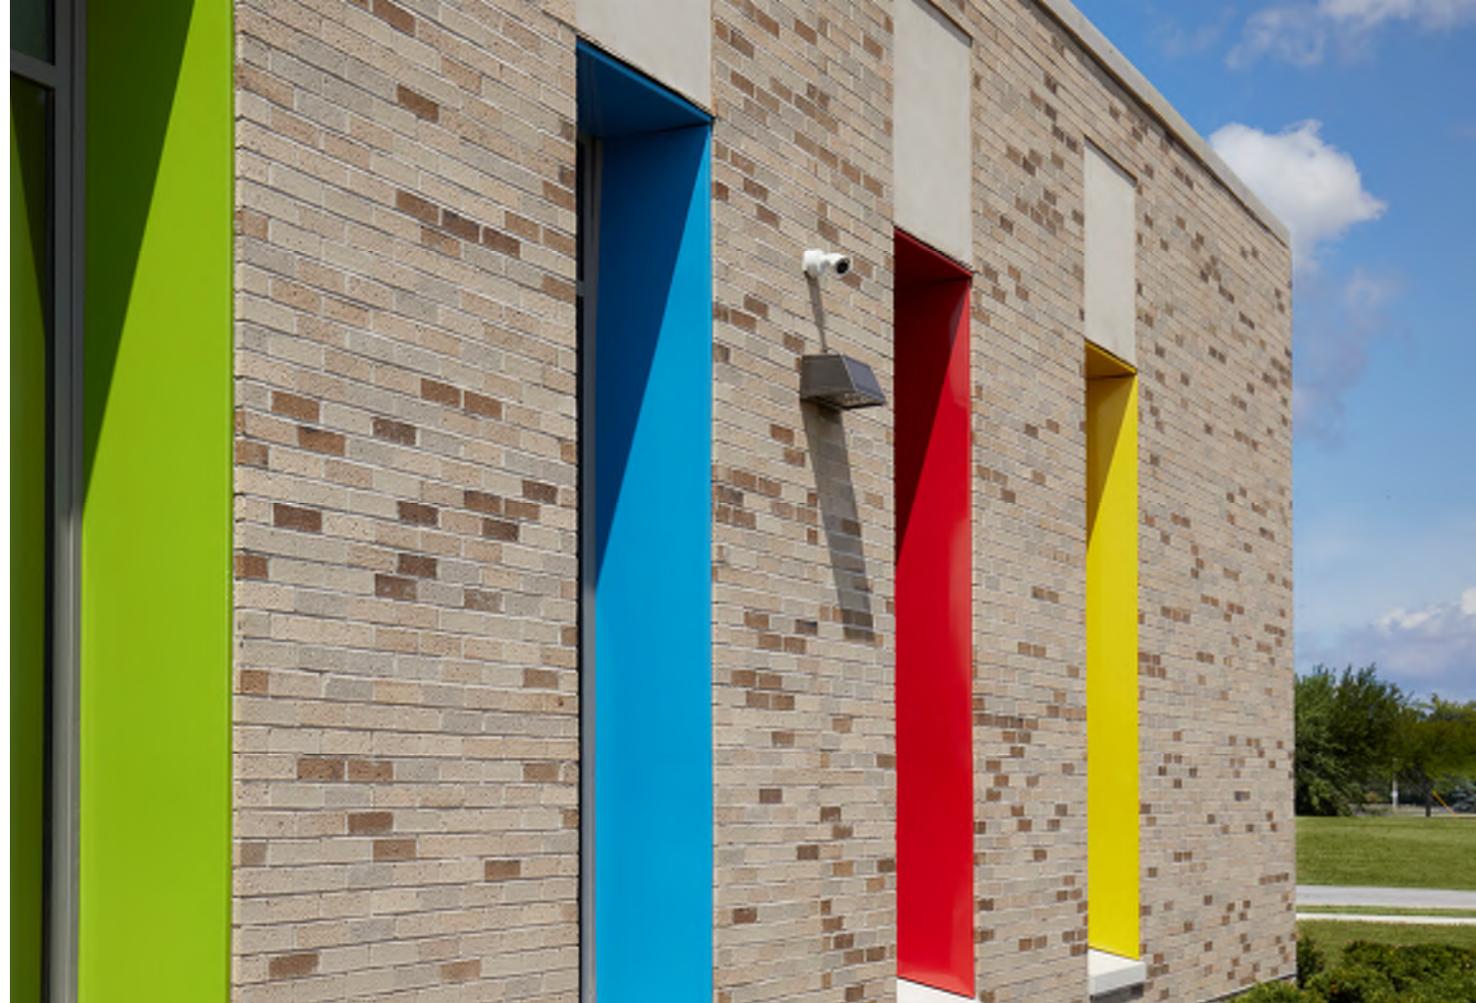

**486** kgCO<sub>2</sub>e/m<sup>2</sup>

Proposed embodied carbon:

**412** kgCO<sub>2</sub>e/m<sup>2</sup> (15% reduction)

Embodied carbon optimization measures:

- Added fly ash content to concrete.
- Reduced cantilever / structural steel.
- Reduced curtainwall system areas (good for operational carbon too).
- Changed XPS and fiberglass batt to mineral wool.
- Supplanted some limestone for brick.

Source: Browning Day

# Case Study: Infosys Training Center

# Case Study

## Infosys Training Center

Indianapolis, Indiana

Gross area: 160,585 sf.

Corporate headquarters and training center.

Tracking LEED v4 Platinum.

24% energy improvement over baseline.

400kW on-site photovoltaic system to offset \$75,000 / year in energy costs.

Energy conservation measures include:

- Optimized envelope solutions.
- High-efficiency mechanicals.
- Daylight / lighting optimization.

Project reveals the embodied carbon intensity of “heavy” structures.

# Environmental Product Declarations

## Product transparency documents.

Lots of them:

- Environmental Product Declarations (EPDs).
- Declare label.
- Health Product Declarations.
- Etc.

But extremely difficult to compare products for optimization with regard to environmental / human health impacts.

EPDs are a premiere source for embodied carbon information for specific building products.

Think of EPDs like nutrition labels on food.

## Product Impacts

### LCA: Results

**Information on un-declared modules:**  
Modules B3 - B7 are not relevant during the service life of the carpet and are therefore not declared.  
Modules C1, C3/1 and C3/2 cause no additional impact (see "LCA: Calculation rules") and are therefore not declared.  
Module C2 represents the transport for scenarios 1, 2 and 3.  
Column D represents the end of life (EOL).

# Aggregating EPDs into a Project Model

The EC3 Tool could be a game-changer.

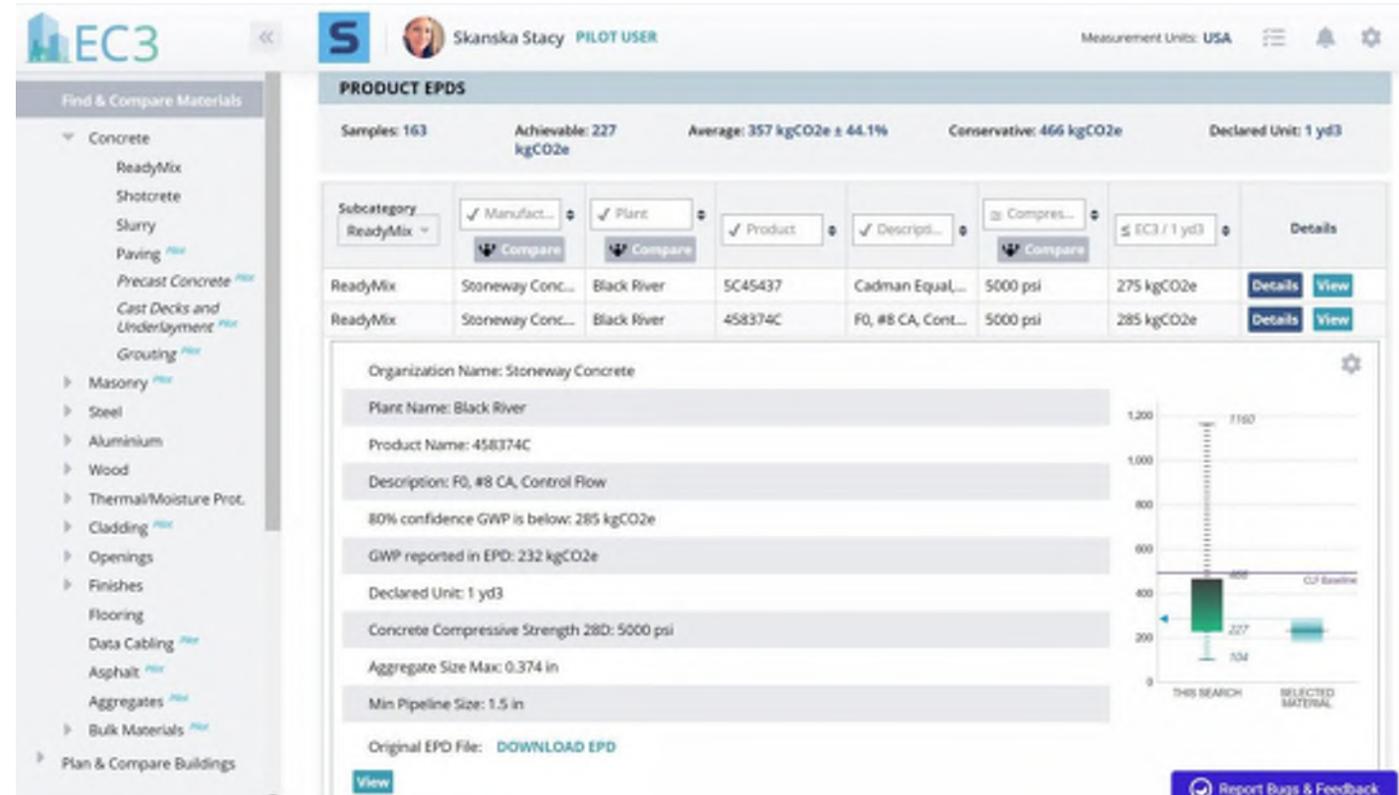

The Embodied Carbon in Construction Calculator (EC3) tool.

From the Carbon Leadership Forum (University of Washington).

Free and easy-to-use; allows benchmarking, assessment and reductions in embodied carbon.

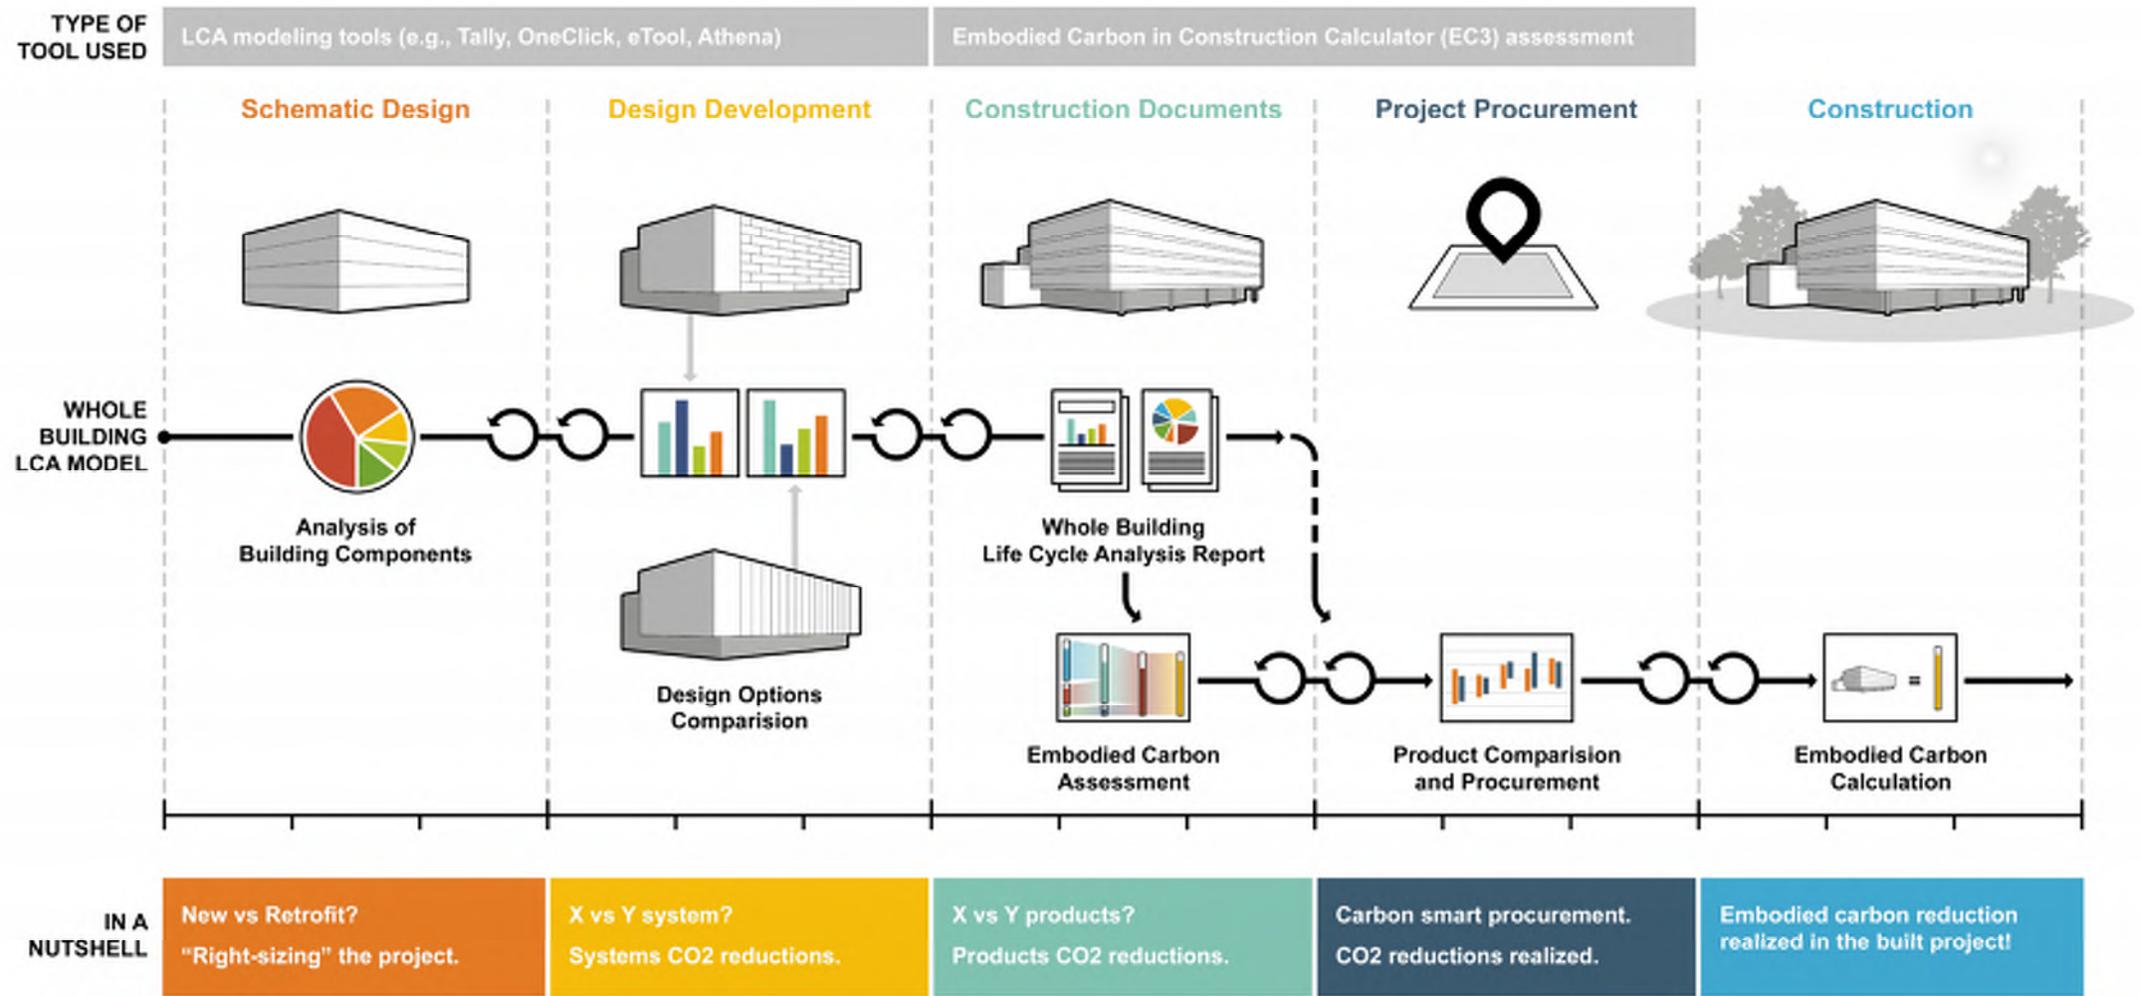

Allows for supply chain specific analysis of embodied carbon data, utilizing the first searchable and sortable database of all United States and Canadian Environmental Product Declarations (EPDs).

# Whole-Building Embodied Carbon Modeling Workflow

Source: Daniel Overbey, adapted from the University of Washington

**Gauging total carbon intensity**

**5**

**Shift the conversation to *total carbon intensity*.**

**Annual U.S. CO<sub>2</sub>e emissions: ~ 5 B Tonnes**

28% operational carbon: 1.4 B Tonnes

11% embodied carbon: 0.6 B Tonnes

**Emerging data on embodied carbon suggests:**

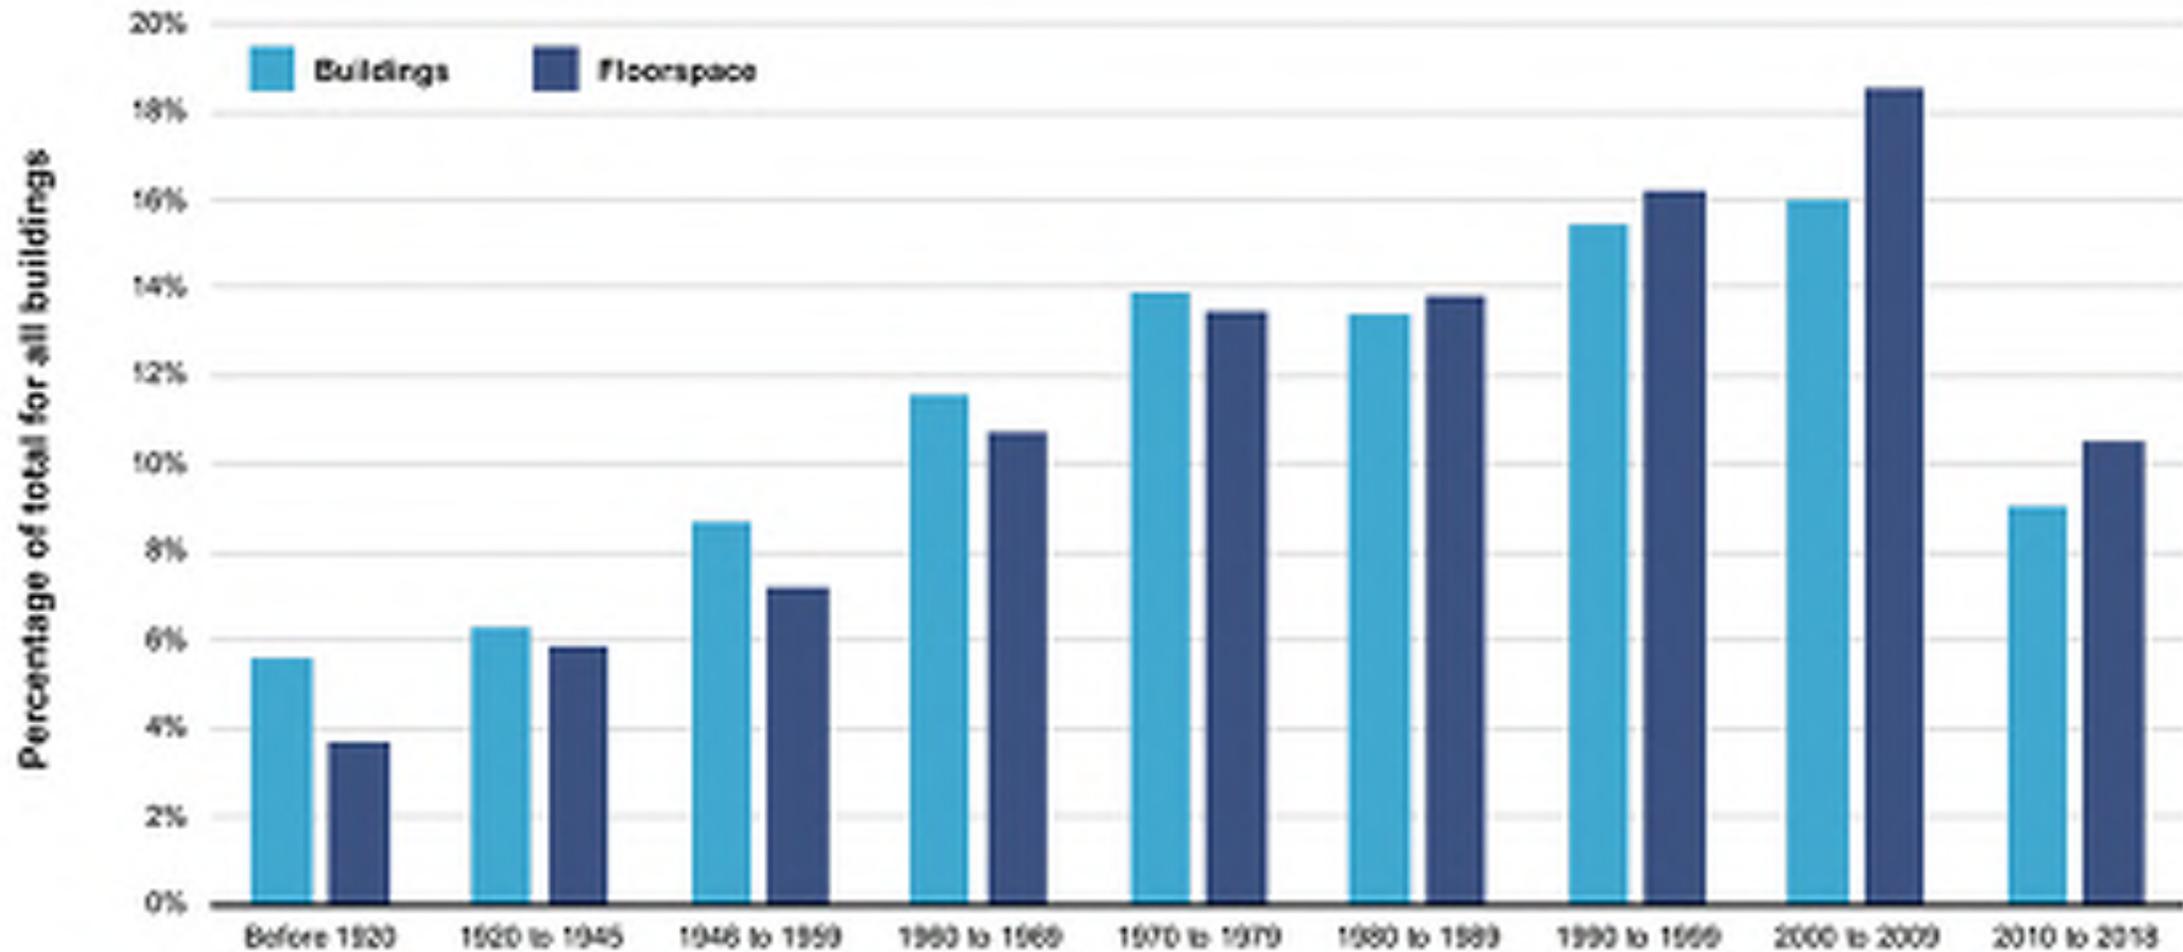

< 150 kgCO<sub>2</sub>e/m<sup>2</sup> = good

> 1,000 kgCO<sub>2</sub>e/m<sup>2</sup> = bad

**We now have tools and workflows.**

**Huge opportunity to improve existing buildings.**

## **Four measures can reduce total carbon intensity by 3/4:**

1. Electrification with grid decarbonization by 2050.
2. Updated energy code (and strive toward net zero).
3. Design optimization for ( $\geq 20\%$ ) embodied carbon.
4. Prioritize renovation.

**These measure could reduce total U.S. emissions by 29%, saving over 1.5 Billion Tonnes of CO<sub>2</sub>e every year.**

## How to achieve zero carbon?

### Operational carbon:

- Advanced refrigerants.
- On-site renewable energy with smart systems and demand flexibility.
- Utilize battery backups and EVs in an aggregator program.

### Embodied:

- Carbon sink materials when possible.

**Thank you!**
