

## **CONDITIONS WE TREAT – SPEECH & SWALLOWING DIFFICULTIES, THROAT**

Speech and swallowing can be directly affected when cervical nerves flowing to the muscles and tissues of the throat from the neck region are compressed or irritated by spinal misalignment and degeneration. Of course it is extremely important to have a thorough check up to determine that the general health of the throat is fine and that no tumor growth or serious problem is present. Barring such problems spinal nerve compression is a common disorder that can produce spasm or irritation of throat muscles and other area tissues. Spinal adjustments can be most helpful to correct these problems.
