

Use this procedure for all artificial nail applications.

Nail Preparation

1. Use normal wash and sanitize procedures for hands.
2. Remove Polish or any other products or material from the natural nail bed.
3. Gently push back the cuticle – and remove cuticle (pterygium) from the nail plate.
4. Remove the shine from the nail plate using a medium to fine grit file or buffer. Use a forward and back motion from the cuticle area to the free-edge and remove shine and moisture from the natural nail plate.
5. Remove the filing dust from the nail plate. A manicure brush will work the best.
6. Apply a coat of **Nail Prep Dehydrator/ Balance** to the natural nail. This will cleanse and prep the surface of the nail plate.
7. Apply **Fusion/Bonder** non-acid primer for adhesion of acrylic. The Bonder will work in approximately 30 seconds and have a continued wet “look” or appearance.
8. Apply *nail forms* or *nail tips* to the nails.

Proceed with regular artificial nail application.
