COMPLAINT

Plaintiff K.Mizra LLC (“K.Mizra”) files this Complaint against Defendant Fortinet, inc. (“Fortinet”).

NATURE OF THE CASE

1. This is an action for the infringement of U.S. Patent Nos. 8,234,705 (the “’705 patent”), 9,516,048 (“the ’048 patent”), and 8,965,892 (the “’892 patent”) or also referred to as “the Patents-in-Suit.”

2. Defendant Fortinet has been making, selling, using and offering for sale computer network security products such as FortiNAC, the FortiNAC Server, FortiNAC Control Server, and FortiNAC Application Server,¹ the Endpoint compliance feature set,² FortiNAC Agents,³

¹ See Exhibit D, FortiNAC Administration Guide at 1, (excerpted) (available at <https://fortinetweb.s3.amazonaws.com/docs.fortinet.com/v2/attachments/dc02a854-ab11-11ea-8b7d-00505692583a/AdminGuide-880-PDF.pdf>, last visited June 29, 2021); see also, *id.* at 440, (“The Persistent Agent only works with the FortiNAC Control Server and FortiNAC Application Server pair or the FortiNAC Server. If the FortiNAC Control Server is not paired with the FortiNAC Application Server, the Dissolvable Agent must be used.”).

² See *id.* at 434.

³ See *id.* at 435.

FortiNAC Polices (including at least the Endpoint Compliance Policies and Endpoint Compliance Configurations),⁴ Admin Scan Configurations (including the Remediation Configuration),⁵ Scans, including with the Scan on Connect option,⁶ Custom Scans,⁷ and various other Fortinet network equipment, including the FortiNAC appliances (e.g., the FortiNAC-CA-500C, 500C 600C, 700C, and FortiNAC-M-500C),⁸ and software, including the FortiNAC Virtual Machine,⁹ incorporating similar technology that infringe the '705 and '048 patents in violation of 35 U.S.C. § 271 (collectively, “the '705/'048 Accused Instrumentalities”).

3. Defendant Fortinet has been making, selling, using and offering for sale computer email security products such as FortiMail,¹⁰ including the Session Profile,¹¹ the Sender Reputation feature,¹² FortiGuard’s IP Reputation feature,¹³ and various other Fortinet network equipment, Fortinet Appliances (including, the FORTIMAIL 200F, 400F, and 900F)¹⁴ and software, including Virtual Machines,¹⁵ incorporating similar technology that infringe the '892 patent in violation of 35 U.S.C. § 271 (collectively, “the '892 Accused Instrumentalities”).

4. Plaintiff K.Mizra seeks appropriate damages and prejudgment and post-judgment interest for Fortinet’s infringement of the Patents-in-Suit.

⁴ See *id.* at 361.

⁵ See *id.* at 380.

⁶ See *id.* at 384.

⁷ See *id.* at 402.

⁸ See Exhibit E, Network Access Control (NAC) (available at <https://www.fortinet.com/products/network-access-control>), last visited July 6, 2021).

⁹ See *id.*

¹⁰ See Exhibit F, FortiMail Datasheet at 1 (available at <https://www.fortinet.com/content/dam/fortinet/assets/data-sheets/FortiMail.pdf>), last visited June 21, 2021).

¹¹ See Exhibit G, FortiMail Administration Guide at 399-401 (excerpted) (available at https://fortinetweb.s3.amazonaws.com/docs.fortinet.com/v2/attachments/6c60719d-0e64-11eb-96b9-00505692583a/FortiMail-6.4.3-Administration_Guide.pdf), last visited June 29, 2021).

¹² See *id.*

¹³ See *id.*

¹⁴ See Exhibit F, FortiMail Datasheet at 8.

¹⁵ See *id.* at 5 (disclosing virtual machines for running on popular hypervisor platforms including: VMWare, Citrix XenServer, Hyper-V, KVM, AWS, and Azure).

THE PARTIES

5. Plaintiff K.Mizra is a Delaware limited liability company with its principal place of business at 777 Brickell Ave, #500-96031, Miami, FL 33131. K.Mizra is the assignee and owner of the Patents-in-Suit.

6. Defendant Fortinet is a corporation organized under the laws of Delaware, with a place of business located at 6111 W. Plano Parkway, Plano, TX 75093. Fortinet is registered to conduct business in the state of Texas and has appointed Corporation Service Company d/b/a CSC-Lawyers Incorporating Service Company, located at 211 E. 7th St., Suite 620, Austin, TX 78701, as its agent for service of process.

7. By maintaining facilities in Plano, Fortinet has a regular and established place of business in the Eastern District of Texas.

8. K.Mizra sent letters to Fortinet in January 2021 and then again in February 2021 about taking a license to K.Mizra's patent portfolio. To date, Fortinet has not responded to any of K.Mizra's correspondence regarding taking a license to Mizra's patents.

9. Fortinet has been on notice of its infringement of the Patents-in-Suit at least as of the date of service of this Complaint.

10. Notwithstanding its receipt of notice that the '705/'048 Accused Instrumentalities and the '892 Accused Instrumentalities infringe the Patents-in-Suit, including notice provided as of the filing of this complaint, Fortinet continues to sell these Accused Instrumentalities in flagrant disregard of K.Mizra's rights under the Patents-in-Suit.

JURISDICTION AND VENUE

11. This is an action for patent infringement arising under the Patent Laws of the United States, Title 35 of the United States Code.

12. This Court has original subject matter jurisdiction under 28 U.S.C. §§ 1331 and 1338(a).

13. This Court has personal jurisdiction over Fortinet because, *inter alia*, Fortinet has a continuous presence in, and systematic contact with, this District and has registered to conduct business in the state of Texas.

14. Fortinet has committed and continues to commit acts of infringement of K.Mizra's Patents-in-Suit in violation of the United States Patent Laws, and has made, used, sold, offered for sale, marketed and/or imported infringing products into this District. Fortinet's infringement has caused substantial injury to K.Mizra, including within this District.

15. Venue is proper in this District pursuant to 28 U.S.C. §§ 1400 and 1391 because Fortinet has committed acts of infringement in this District and maintains a regular and established place of business in this District.

THE PATENTS-IN-SUIT

A. U.S. Patent 8,234,705 and U.S. 9,516,048

16. The '705 patent is titled "Contagion Isolation and Inoculation" and was issued by the United States Patent Office to inventors James A. Roskind and Aaron R. Emigh on July 31, 2012. The earliest application related to the '705 patent was filed on September 27, 2004. A true and correct copy of the '705 patent is attached as Exhibit A.

17. K.Mizra is the owner of all right, title and interest in and to the '705 patent with the full and exclusive right to bring suit to enforce the '705 patent.

18. The '705 patent is valid and enforceable under the United States Patent Laws.

19. The '048 patent is titled "Contagion Isolation and Inoculation Via Quarantine" and was issued by the United States Patent Office to inventors Aaron R. Emigh and James A. Roskind

on December 6, 2016. The earliest application related to the '048 patent was filed on September 27, 2004. A true and correct copy of the '048 patent is attached as Exhibit B.

20. K.Mizra is the owner of all right, title and interest in and to the '048 patent with the full and exclusive right to bring suit to enforce the '048 patent.

21. The '048 patent is valid and enforceable under the United States Patent Laws.

22. The claims of the '705 and '048 patents are directed to technological solutions that address specific challenges grounded in computer network security. The security of computer systems and networks is a tremendous concern for modern enterprises, since a breach of an internal network can have severe repercussions, including major financial losses, data theft, disclosure of sensitive information, network disruptions, and data corruption—any of which could have devastating consequences to a business, at any scale. The inventors of the '705 and '048 patents understood that while a network security appliance or hardware can be adept at keeping out unwanted external intrusions into the network, the most exploitable vulnerabilities of a computer network are the end-user computers that roam throughout various other public and private network domains and then access the presumably secure network day in and day out.

23. For example, the '705 patent explains that “[l]aptop and wireless computers and other mobile systems pose a threat to elements comprising and/or connected to a network service provider, enterprise, or other protected networks to which they reconnect after a period of connection to one or more networks and/or systems that are not part of the service provider, enterprise, or other protected network. By roaming to unknown domains, such as the Internet, and/or connecting to such domains through public, wireless, and/or otherwise less secure access nodes, such mobile systems may become infected by computer viruses, worms, backdoors, and/or countless other threats and/or exploits and/or have unauthorized software installed; have software

installed on the mobile system by an operator of the protected network for the protection of the mobile system and/or the protected network removed or altered without authorization; and/or have configurations, settings, security data, and/or other data added, removed, and/or changed in unauthorized ways and/or by unauthorized person.” *See, e.g.*, Exhibit A at 1:14-31.

24. While Information Technology (IT) engineers may have been able to keep on-site systems secure and up to date with the technology available at that time, they still faced challenges with off-site devices such as a worker’s personal laptop or mobile device which posed significant security risks that could allow attackers or viruses stealth access into a business’s network, bypassing IT security measures. For example, the ’705 patent states that “[u]pon connecting to a protected network, a system may infect or otherwise harm resources associated with the protected network before measures can be taken to detect and prevent the spread of such infections or harm.” *See, e.g.*, Exhibit A at 1:34-38.

25. The invention of the ’705 and ’048 patents close this loophole by verifying that any device attempting to access a company’s network meets the company’s standards for network security and will not introduce dangerous computer programs or viruses into the company’s network. For example, the ’705 patent describes that when “a request is received from a host, e.g., via a network interface, to connect to a protected network, it is determined whether the host is required to be quarantined. According to the ’705 and ’048 patents, if the host is required to be quarantined, the host is provided only limited access to the protected network. *See, e.g.*, Exhibit A at 3:13-20, Exhibit B at 11:58-66. In some embodiments, a quarantined host is permitted to access the protected network only as required to remedy a condition that caused the quarantine to be imposed, such as to download a software patch, update, or definition; install, remove, and/or configure software and/or settings as required by a policy; and/or to have a scan or other diagnostic

and/or remedial operation performed.” *See* Exhibit A at 3:8-20, Exhibit B at 12:21-28. The ’705 and ’048 patents further describe that “attempts to communicate with hosts not involved in remediation are redirected to a quarantine system, such as a server, that provides information, notices, updates, and/or instructions to the user.” Exhibit A at 3:20-23, Exhibit B at 12:28-33.

26. The ’705 and ’048 patents disclose an improvement in computer functionality related to computer network security. For instance, an infected host computer with malicious code, such as a computer virus, worm, exploits and the like (“malware”), poses a serious threat if the malware spreads to other hosts in a protected network. Exhibit A at 1:14-41, Exhibit B at 1:42-46. The claims of the ’705 and ’048 patents employ techniques, unknown at the time of the invention, that do more than detect malware *per se*. The claimed techniques quarantine an infected host to prevent it from spreading malware to other hosts while still permitting limited communications with the network to remedy the malware. As a result, the ’705 and ’048 patents provide a technological solution to a problem rooted in computer technology by improving the way networks are secured. Through the implementation and provision of this technology by network security companies such as Fortinet, businesses are able to increase their security from vulnerable elements that access their networks.

27. The claims of the ’705 and ’048 patents address the technological problems not by a mere nominal application of a generic computer to practice the invention, but by carrying out particular improvements to computerized network security technology in order to overcome problems specifically grounded in the field of computer network security. As the ’705 and ’048 patents explain, determining whether a quarantine is required involves detection by a computing device, router, firewall, or other network component as to the infestation or cleanliness of a computer. Exhibit A at 11:15-28, Exhibit B at 11:35-49. Moreover, the subsequent steps such as

quarantining, limiting network access, remediation, and redirecting network communications are functions fundamentally rooted in computer network technology.

28. The claims of the '705 and '048 patents recite subject matter that is not merely the routine or conventional use of computer network security that existed in the prior art. Instead, the claimed inventions are directed to particularized implementations of assessing and responding to an external network access request in a way that protects the computer network and systems from malicious or undesired breaches. The claims of the '705 and '048 patents specify how a secure network can assess and respond to an external network access request without jeopardizing network integrity.

B. U.S. Patent 8,965,892

29. The '892 patent is titled "Identity-Based Filtering" and was issued by the United States Patent Office to inventor Aaron T. Emigh on February 24, 2015. The earliest application related to the '892 patent was filed on January 4, 2007. A true and correct copy of the '892 patent is attached as Exhibit C.

30. K.Mizra is the owner of all right, title and interest in and to the '892 patent with the full and exclusive right to bring suit to enforce the '892 patent.

31. The '892 patent is valid and enforceable under the United States Patent Laws.

32. The claims of the '892 patent are directed to technological solutions that address specific challenges rooted in computing technology involving the filtering of electronic content. With the proliferation of electronic documents and content on the internet such as PDFs, webpages, and electronic mail that are accessible via a network address or that traverse a computer network, there is a myriad of undesirable content that a computer user may encounter. *See* Exhibit C at 1:19-22. The inventors of the '892 patent understood the shortcomings of the traditional approaches to

filtering unwanted content that were solely based on including or excluding certain addresses or uniform resource locators (URLs) associated with the document. The '892 patent explains that prior to its invention, “[a] variety of approaches to content filtering have been employed to avoid undesirable content. Examples of such approaches include blacklisting and whitelisting URLs and sites. However, these approaches fail to discriminate between specific content owners or creators within a site. In some cases, particular participants in a site or service may have more desirable, or less desirable, content than other participants, and present approaches are unable to take advantage of this, leading to either inclusion of objectionable content, or exclusion of desirable content.” *Id.* at 1:23-32.

33. The technological invention of the '892 patent improves upon these conventional techniques for computerized filtering of electronic documents over the internet by extracting and resolving certain data inherent in the electronic document to correlate and determine the reputations of the author or sender of the document and the group in which he or she may be a member of. For example, the '892 patent describes “extracting an identity from a document and/or metadata” and analyzing content with “content analyzing technologies” such as Bayesian filtering or Support Vector Machines. *See, e.g., id.* at 2:24-36. The '892 patent also discusses further steps of correlating identity, detecting affiliation, and determining reputation associated with electronic documents over a computer network. *Id.* at 1:38-63. The enhanced filtration techniques taught by the '892 patent can be carried out “programmatically via an API or by retrieving one or more pages from the network and analyzing them.” *See, e.g., id.* at 6:5-67.

34. The '892 patent claims a way to solve technological problems that existed within the field of electronic documents and computer technology. It provides a technological solution to a problem specific to technology related to electronic documents by improving computer

functionality for filtering electronic documents. Faced with the shortcomings of plain filtering techniques such as white-listing or black-listing that existed at the time of the invention, the inventors of the '892 patent developed a far more advanced approach with specific steps for determining and correlating group-related reputation and identity reputation. By utilizing such improvements to electronic content filtering technology, data security companies such as Cisco are able to take advantage of more optimally tailored filtering to block unwanted documents such as electronic mail on computer networks without sacrificing the over-exclusion of desired content.

35. The way in which the claims of the '892 patent address the technological problem is not merely a nominal application of a generic computer to practice the invention. Instead, the claims of the '892 patent implement particular improvements to computerized data filtering technology in order to overcome the problems specifically arising in the field of electronic content filtering.

36. The claims of the '892 patent recite subject matter that is not merely the routine or conventional use of filtering undesired electronic documents that existed in the prior art. Instead, the claimed inventions are directed to particularized implementations of determining the reputation associated with electronic documents. The '892 patent claims specify improved computer functionality for extracting certain information and data inherent in the electronic documents for purposes of resolving the reputations associated with the document, author of the document, and groups of which the author may be a member.

FIRST CAUSE OF ACTION
(PATENT INFRINGEMENT UNDER 35 U.S.C. § 271 of '705 PATENT)

37. K.Mizra re-alleges and incorporates by reference all of the foregoing paragraphs.

38. On information and belief, Fortinet has infringed and continues to infringe, either literally or under the doctrine of equivalents, one or more claims, including at least claim 19, of

the '705 patent in violation of 35 U.S.C. §§ 271 et seq., by making, using, importing, selling, offering for sale, and/or importing in this District and into the United States certain products including, but not limited to those, relating to the '705/'048 Accused Instrumentalities.

39. For example, Claim 19 of the '705 patent recites the following:

[preamble] A computer program product for protecting a network, the computer program product being embodied in a non-transitory computer readable medium and comprising instructions for:

[A] detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network,

[B] wherein detecting the insecure condition includes:

[B1] contacting a trusted computing base associated with a trusted platform module within the first host,

[B2] receiving a response, and determining whether the response includes a valid digitally signed attestation of cleanliness,

[C] wherein the valid digitally signed attestation of cleanliness includes at least one of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host;

[D] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

[E] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes

[E1] receiving a service request sent by the first host, serving a quarantine notification page to the first host when the service request comprises a web server request,

[E2] and in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition; and

[F] permitting the first host to communicate with the remediation host.

40. On information and belief, and based on publicly available information, at least the '705/'048 Accused Instrumentalities satisfy each and every limitation of at least claim 19 of the '705 patent.

41. The preamble recites a “computer program product for protecting a network.” To the extent the preamble is determined to be limiting, the '705/'048 Accused Instrumentalities provide the features described in the preamble. For example, Fortinet describes NAC (Network Access Control) as at least including, authentication and authorization of devices, denial of unsecured devices, and quarantine of unsecured devices:

How Network Access Control Secures Your Network

NAC network security provides visibility over everything connected to the network, as well as the ability to control those devices and users, including dynamic, automated responses. It plays a role in strengthening overall network security infrastructure.

A properly functioning solution can prevent access to noncompliant users or devices, place them in quarantine, or restrict access to a small number of network resources, separated from the rest of the network. A network access control policy generally supports the following:

1. Authentication and authorization of users and devices
2. User and device profiling
3. Denial of unsecured devices
4. Quarantine of unsecured devices
5. Restricting access to unsecured devices
6. Policy lifecycle management
7. Overall security posture assessment
8. Incident response through policy enforcement
9. Guest networking access

See Exhibit E, Network Access Control (NAC) at “How Network Access Control Secures Your Network” (underlining added). To implement NAC, the FortiNAC product line includes hardware appliances (including the FortiNAC-CA-500C, 500C 600C, 700C, and FortiNAC-M-500C), virtual machines, and licenses, where each FortiNAC deployment requires both a Control and Application server. See *id* at “Models and Specifications.” The FortiNAC user interface is browser based and is hosted by the FortiNAC appliance. See Exhibit D, FortiNAC Administration Guide at 4, “Login procedure.”

42. FortiNAC further provides the “endpoint compliance” feature set that ensures hosts connecting to the network comply with usage requirements, by utilizing host-side agents that scan and evaluate hosts:

Endpoint compliance

Endpoint compliance is a feature set used to ensure that hosts connecting to your network comply with network usage requirements. The cornerstone of endpoint compliance are endpoint compliance policies. Use these policies to establish the parameters for security that will be enforced when hosts connect to the network. If you do not create policies, when hosts connect to the network and users enter their credentials, they will be automatically registered without a policy being applied. See [Endpoint compliance policies on page 361](#).

Endpoint compliance can also use an agent on the host to ensure that compliance with established policies is maintained. The Dissolvable Agent is downloaded during registration and is removed when the host is registered. The Persistent Agent remains on the host. Mobile Agent devices are installed on and remain installed on mobile devices. The Passive Agent is not installed, but is served as the user logs onto the network and does a scan in the background.

Endpoint compliance policies contain scans used to evaluate hosts and ensure that each host complies with your configured list of acceptable operating systems and antivirus software. For a list of supported operating systems and antivirus software, use the customer portal on our web site.

See, e.g., Exhibit D, FortiNAC Administration Guide at 434 (underlining added). Additionally, FortiNAC agents are used to scan hosts and determine whether the host complies with the endpoint compliance policy assigned to that host. *See id.* at 438.

43. Thus, to the extent the preamble of claim 19 is limiting, the ’705/’048 Accused Instrumentalities meet it.

44. Limitation A requires “detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation A of claim 19. For example, the FortiNAC “Scans view” allows administrators to configure host scans for compliance, including when a host connects to the network. *See id.* at 384. Additionally, administrators can configure scans to “Scan on Connect,” which forces a rescan every time the assigned host connects to the network:

Settings

Field	Definition
Scan Name	Each scan must have a unique name.
Remediation	Indicates when the host is moved to Remediation. Options include: On Failure: Host is moved to remediation immediately after failing a scan. Delayed: Host is moved to remediation after a user specified delay if the reason for the scan failure has not been addressed. Audit Only: Host is scanned and a failure report is generated, but the host is never moved to remediation.
<u>Scan On Connect</u>	Indicates whether this option is enabled or disabled. <u>Scan On Connect forces a rescan every time the host assigned this scan connects to the network.</u> See Scan on connect on page 386 . This option only affects hosts running the Persistent Agent.

See id. (underlining added). Therefore, the '705/'048 Accused Instrumentalities meet limitation A of claim 19.

45. Limitation B1 requires that “detecting the insecure condition includes” “contacting a trusted computing base associated with a trusted platform module within the first host.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation B1 of claim 19. For example, FortiNAC provides several types of agents.¹⁶ FortiNAC agents are used to scan hosts and determine whether the host complies with the endpoint compliance policy assigned to that host. *See id.* at 438.

46. Further, as of July 28, 2016, Windows 10 requires all new devices to implement and enable by default TPM 2.0:

¹⁶ *See id.* at 439 (“The Persistent Agent can be downloaded to the host and installed by the user, by a login script or by any other software distribution method your organization might use. The Persistent Agent remains installed on the host at all times. Once the agent is installed it runs in the background and communicates with FortiNAC at intervals established by the FortiNAC administrator.”); *see also id.* at 453 (“The Persistent Agent is an application that works on Windows, macOS, or Linux hosts to identify them to FortiNAC and scan them for compliance with an endpoint compliance policy. This Agent is downloaded and installed on the host permanently. The Persistent Agent installed on a host is designed to “check in” through a periodic heartbeat sent to the Persistent Agent server.”).

TPM 2.0 Compliance for Windows 10

Windows 10 for desktop editions (Home, Pro, Enterprise, and Education)

- Since July 28, 2016, all new device models, lines or series (or if you are updating the hardware configuration of a existing model, line or series with a major update, such as CPU, graphic cards) must implement and enable by default TPM 2.0 (details in section 3.7 of the [Minimum hardware requirements](#) page). The requirement to enable TPM 2.0 only applies to the manufacturing of new devices. For TPM recommendations for specific Windows features, see [TPM and Windows Features](#).

See Exhibit H, “TPM Recommendations” at “TPM 2.0 Compliance for Windows 10” (available at <https://docs.microsoft.com/en-us/windows/security/information-protection/tpm/tpm-recommendations>, last visited June 29, 2021) (underlining added).

47. Therefore, the '705/'048 Accused Instrumentalities meet limitation B1 of claim 19.

48. Limitation B2 requires that “detecting the insecure condition includes” “receiving a response and determining whether the response includes a valid digitally signed attestation of cleanliness.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation B2 of claim 19. For example, FortiNAC provides several types of agents. See Exhibit D, FortiNAC Administration Guide at 438. Moreover, once installed, the Persistent Agent remains installed on the host at all times, running in the background and communicating with FortiNAC. See *id.* at 439. Moreover, SSL certificates are required for securing these communications between the Persistent Agent and a FortiNAC Server (or a FortiNAC Control Server and FortiNAC Application Server pair). See Exhibit I, FortiNAC Deployment Guide at 32, “SSL Certificates” (excerpted) (available at https://fortinetweb.s3.amazonaws.com/docs.fortinet.com/v2/attachments/e7ebbdad-cabf-11ea-8b7d-00505692583a/FortiNAC_Deployment_Guide.pdf, last visited June 29, 2021); see also, Exhibit D, FortiNAC Administration Guide at 440.

49. FortiNAC agents are used to scan hosts and determine whether the host complies with the endpoint compliance policy assigned to that host. *See id.* at 438. Scans typically consist of lists of permitted operating systems and required antivirus software:

Scans typically consist of lists of permitted operating systems and required antivirus software. In addition, custom scans can be created for more detailed scanning such as, searching the registry for particular entries, searching the hard drive for specific files, or verifying that hotfixes have been installed. Individual scans can be scheduled to run at regular intervals if your organization requires frequent rescans.

The results of a scan are stored on the **Host Health** tab in the **Host Properties** view. Refer to [Host health and scanning on page 722](#) for additional information.

See id. at 384 (underlining added). Each time a scan is run, a record of that scan is stored in the database and displayed on the Host Health tab of the Host Properties view:

Host health and scanning

Host health is determined by the endpoint compliance policies, system and administrative states, or scans run on the host. Each time a scan is run a record of that scan is stored in the database and displayed on the **Health** tab of the **Host**

Properties window. Each scan and scan type the host is eligible for is shown along with the name, status, and action. The agent scan shown in bold text and highlighted with a gray bar indicates the scan that is currently applied to the host. Click **Show History** for short-term historical data.

See id. at 722-23 (underlining added).

50. Therefore, the '705/'048 Accused Instrumentalities meet limitation B2 of claim 19.

51. Limitation C requires that “the valid digitally signed attestation of cleanliness includes at least one of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation C of claim 19. For example, endpoint compliance policies have many variables for the host scan. *See id.* at 423, “Scan parameters.” For the antivirus and operating system variables, the scan can be narrowed by setting custom parameters. *See id.* The table below includes a subset of an alphabetical list of all the possible antivirus software parameters that can be configured for scanning Windows:

Parameter	Description	Typical options
AntiVirus definition Date	The date of the required AntiVirus definition files.	YYYY-MM-DD
AntiVirus Engine	The version number of the required AntiVirus Engine. Select the operator that will apply to the definition value found on the host: greater than, equal to, or both.	** > = >=

Parameter	Description	Typical options
Client Security Antimalware Service must be running	Select a setting.	Enabled or disabled
Client Security State Assessment Service must be running	Select a setting.	Enabled or disabled

See id. at 423. Therefore, the '705/'048 Accused Instrumentalities meet limitation C of claim 19.

52. Limitation D requires that “when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation D of claim 19. For example, the “Quarantine VLAN Switching” option is enabled by default. *See id.* at 61. Under this option, if a host fails a scan, it is moved to the quarantine VLAN, which is separate from the production VLAN:

Option	Definition
Quarantine VLAN Switching	When quarantine VLAN Switching is set to Enable and the ports are in the Forced Remediation Group, the appliance switches unregistered hosts that are being scanned to the quarantine VLAN until the scan process is completed. Registered hosts are scanned in the production VLAN. <u>Once the scan is finished and the registered host has passed, the host remains in the production VLAN. If the host fails the scan, it is moved to the quarantine VLAN to remediate.</u> When set to Disable, all hosts remain in the production VLAN during the scan process even if the host fails the scan. Default =Enable

See id. at 61 (underlining added). Therefore, the '705/'048 Accused Instrumentalities meet limitation D of claim 19.

53. Limitation E1 requires that “preventing the first host from sending data to one or more other hosts associated with the protected network includes” “receiving a service request sent by the first host [and] serving a quarantine notification page to the first host when the service request comprises a web server request.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation E1 of claim 19. For example, when a scan (including a custom scan) discovers that a host fails to meet a security policy, the browser is redirected to a web page with the results:

Results

Once the security check has completed, if the host failed to meet the security policy, a results page shown in a browser lists the items that failed and passed.

You can configure a link that the user can click that provides information about items that failed and what to do to correct the problem. Enter this link when you configure the policy. See [Add or modify a scan on page 390](#) for more information.

If you do not provide a link, modify the failure page to provide information for the user to correct the problem and find assistance.

See id. at 459 (underlining added). Therefore, the '705/'048 Accused Instrumentalities meet limitation E1 of claim 19.

54. Limitation E2 requires that “preventing the first host from sending data to one or more other hosts associated with the protected network includes” “in the event the service request comprises a DNS query, providing in response an IP address of a quarantine server configured to serve the quarantine notification page if a host name that is the subject of the DNS query is not associated with a remediation host configured to provide data usable to remedy the insecure condition.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation E2 of claim 19. For example, custom scans can result in redirecting the browser to a web page with details about the requirements that the host failed:

Required

When a custom scan severity level is set to **Required**, if the host fails the scan, the host is set to **At Risk**. The browser is redirected to a web page that contains details about the requirements the host failed. The host self-remediates (corrects the issues causing the failure) and rescans until it meets all requirements. When the host passes the requirements, it is moved to the production network.

See id. at 421 (underlining added). Therefore, the '705/'048 Accused Instrumentalities meet limitation E2 of claim 19.

55. Limitation F requires “permitting the first host to communicate with the remediation host.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation F of claim 19. For example, FortiNAC can be configured with allowed domains that isolated hosts can access to remediate:

Allowed domains

Use the Allowed Domains View to specify the domains and production DNS server that isolated hosts use to gain access to network locations. For example, if hosts are in isolation because they do not have the latest virus definitions for their virus software, they would need to be able to access the web site for their virus software to download virus definitions.

See id. at 58 (underlining added).

Domains	A list of authorized domains that an isolated host is permitted to access, such as microsoft.com.
---------	---

See id.

56. Therefore, the '705/'048 Accused Instrumentalities meet limitation F of claim 19.

57. Accordingly, on information and belief, the '705/'048 Accused Instrumentalities meet all the limitations of, and therefore infringes, at least claim 19 of the '705 patent.

58. As a result of Fortinet's infringement of the '705 patent, K.Mizra has suffered and continues to suffer substantial injury and is entitled to recover all damages caused by Fortinet's infringement to the fullest extent permitted by the Patent Act, together with prejudgment interest and costs for Fortinet's wrongful conduct.

SECOND CAUSE OF ACTION
(PATENT INFRINGEMENT UNDER 35 U.S.C. § 271 of '048 PATENT)

59. K.Mizra re-alleges and incorporates by reference all of the foregoing paragraphs.

60. On information and belief, Fortinet has infringed and continues to infringe, either literally or under the doctrine of equivalents, one or more claims, including at least claim 17, of the '048 patent in violation of 35 U.S.C. §§ 271 et seq., by making, using, importing, selling, offering for sale, and/or importing in this District and into the United States certain products including, but not limited to those, relating to the '705/'048 Accused Instrumentalities.

61. For example, Claim 17 of the '048 patent recites the following:

[preamble] A computer program product for protecting a network, the computer program product being embodied in a non-transitory computer readable medium and comprising instructions for:

[A] detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network,

[B] wherein detecting the insecure condition includes

[B1] contacting a trusted computing base associated with a trusted platform module within the first host,

[B2] receiving a response, and determining whether the response includes a valid digitally signed attestation of cleanliness,

[C] wherein the valid digitally signed attestation of cleanliness includes at least one attestation elected from the group consisting of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host;

[D] when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network,

[E] wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes

[E1] receiving a service request sent by the first host, determining whether service request sent by the first host is associated with a remediation request, and when it is

determined that the service request sent by the first host is associated with a remediation request, serving a quarantine notification page that provides remediation information to the first host if the service request sent by the first host comprises a web server request

[E2] wherein serving the quarantine notification page to the first host includes re-routing by responding to the service request by the first host to be directed to a quarantine server configured to serve the quarantine notification page; and

[F] permitting the first host to communicate with the remediation host configured to provide data usable to remedy the insecure condition.

62. On information and belief, and based on publicly available information, at least the '705/'048 Accused Instrumentalities satisfy each and every limitation of at least claim 17 of the '048 patent.

63. The preamble recites a “computer program product for protecting a network.” Regarding the preamble of claim 17, to the extent the preamble is determined to be limiting, the '705/'048 Accused Instrumentalities provide the features described in the preamble. *See, e.g.*, ¶¶ 39-41 ('705 patent preamble analysis). Thus, to the extent the preamble of claim 17 is limiting, the '705/'048 Accused Instrumentalities meet it.

64. Limitation A recites “detecting an insecure condition on a first host that has connected or is attempting to connect to a protected network.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation A of claim 17. *See, e.g.*, ¶ 42 ('705 patent Limitation A analysis). Thus, the '705/'048 Accused Instrumentalities meet limitation A of claim 17.

65. Limitation B1 recites “wherein detecting the insecure condition includes” “contacting a trusted computing base associated with a trusted platform module within the first host.” The '705/'048 Accused Instrumentalities also meet all the requirements of limitation B1 of claim 17. *See, e.g.*, ¶¶ 43-45 ('705 patent Limitation B1 analysis). Thus, the '705/'048 Accused

Instrumentalities meet limitation B1 of claim 17.

66. Limitation B2 recites “wherein detecting the insecure condition includes” “receiving a response, and determining whether the response includes a valid digitally signed attestation of cleanliness.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation B2 of claim 17. *See, e.g.*, ¶¶ 46-48 (’705 patent Limitation B2 analysis). Thus, the ’705/’048 Accused Instrumentalities meet limitation B2 of claim 17.

67. Limitation C recites “wherein the valid digitally signed attestation of cleanliness includes at least one attestation elected from the group consisting of an attestation that the trusted computing base has ascertained that the first host is not infested, and an attestation that the trusted computing base has ascertained the presence of a patch or a patch level associated with a software component on the first host.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation C of claim 17. *See, e.g.*, ¶ 49 (’705 patent Limitation C analysis). Thus, the ’705/’048 Accused Instrumentalities meet limitation C of claim 17.

68. Limitation D recites “when it is determined that the response does not include a valid digitally signed attestation of cleanliness, quarantining the first host, including by preventing the first host from sending data to one or more other hosts associated with the protected network.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation D of claim 17. *See, e.g.*, ¶ 50 (’705 patent Limitation D analysis). Thus, the ’705/’048 Accused Instrumentalities meet limitation D of claim 17.

69. Limitation E1 recites “wherein preventing the first host from sending data to one or more other hosts associated with the protected network includes” “receiving a service request sent by the first host, determining whether service request sent by the first host is associated with a remediation request, and when it is determined that the service request sent by the first host is

associated with a remediation request, serving a quarantine notification page that provides remediation information to the first host if the service request sent by the first host comprises a web server request.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation E1 of claim 17. *See, e.g.*, ¶ 51 (’705 patent Limitation E1 analysis). Thus, the ’705/’048 Accused Instrumentalities meet limitation E1 of claim 17.

70. Limitation E2 recites “wherein serving the quarantine notification page to the first host includes re-routing by responding to the service request by the first host to be directed to a quarantine server configured to serve the quarantine notification page.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation E2 of claim 17. *See, e.g.*, ¶ 52 (’705 patent Limitation E2 analysis). Thus, the ’705/’048 Accused Instrumentalities meet limitation E2 of claim 17.

71. Limitation F recites “permitting the first host to communicate with the remediation host configured to provide data usable to remedy the insecure condition.” The ’705/’048 Accused Instrumentalities also meet all the requirements of limitation F of claim 17. *See, e.g.*, ¶¶ 53-54 (’705 patent Limitation F analysis). Thus, the ’705/’048 Accused Instrumentalities meet limitation F of claim 17.

72. Accordingly, on information and belief, the ’705/’048 Accused Instrumentalities meet all the limitations of, and therefore infringe, at least claim 17 of the ’048 patent.

73. As a result of Fortinet’s infringement of the ’048 patent, K.Mizra has suffered and continues to suffer substantial injury and is entitled to recover all damages caused by Fortinet’s infringement to the fullest extent permitted by the Patent Act, together with prejudgment interest and costs for Fortinet’s wrongful conduct.

THIRD CAUSE OF ACTION
(PATENT INFRINGEMENT UNDER 35 U.S.C. § 271 of '892 PATENT)

74. K.Mizra re-alleges and incorporates by reference all of the foregoing paragraphs.

75. On information and belief, Fortinet has infringed and continues to infringe, either literally or under the doctrine of equivalents, one or more claims, including at least claim 15 of the '892 patent in violation of 35 U.S.C. §§ 271 et seq., by making, using, importing, selling, offering for sale, and/or importing in this District and into the United States certain products, including but not limited to those, relating to the '892 Accused Instrumentalities.

76. On information and belief, Fortinet has been and currently is infringing the '892 patent by the manufacture, use, sale, offer to sell and/or importation of its products, including at least the '892 Accused Instrumentalities under 35 U.S.C. § 271.

77. For example, Claim 15 of the '892 patent recites the following:

[preamble] A non-transitory computer program product for determining a reputation associated with an electronic document accessible via a network address, the computer program product being embodied in a computer readable storage medium and comprising computer instructions for:

[A] determining an identity relating to a person, wherein the identity is associated with the electronic document;

[B] determining that the person is a member of a group, wherein the group is associated with a group-related service and wherein the group is associated with a group reputation;

[C] determining an identity reputation, wherein the identity reputation is associated with the identity and wherein the identity reputation is based at least in part on the group reputation; and

[D] determining a document reputation, wherein determining the document reputation uses the identity reputation.

78. On information and belief, and based on publicly available information, at least the '892 Accused Instrumentalities satisfy each and every limitation of at least claim 15 of the '892 patent.

79. The preamble of claim 15 recites a “non-transitory computer program product for determining a reputation associated with an electronic document accessible via a network address.” Regarding the preamble of claim 15, to the extent the preamble is determined to be limiting, the ’892 Accused Instrumentalities provide the features described in the preamble. For example, FortiMail “delivers advanced multi-layered protection against the full spectrum of email-borne threats.” *See* Exhibit F, FortiMail Datasheet at 1.

80. Further, FortiMail provides anti-spam functionality by using reputation analysis, that includes checks on IP, domain, and sender:

Multi-Layered Anti-Spam

Multiple sender, protocol and content inspection techniques shield users from spam and junk mail. Using a combination of reputation analysis, connection filtering, authentication and recipient verification methods allows for fast and accurate email protection. Checks include IP, domain, sender, SPF, DKIM, DMARC and geographical restrictions.

See id. at 2 (underlining added).

81. Specifically, FortiMail provides a local sender reputation feature, while the FortiGuard Antispam Service provides a sender and domain reputation feature:

ANTISPAM

FortiGuard Antispam Service

- Sender and domain reputation
- Spam and attachment signatures
- Dynamic heuristic rules
- Outbreak protection

Full FortiGuard URL Category Filtering includes:

- Spam, malware and phishing URLs
- Pornographic and Adult URLs
- Newly registered domains

Greylisting for IPv4, IPv6 addresses and email accounts

Local sender reputation (IPv4, IPv6 and End Point ID-based)

Behavioral analysis

Integration with third-party spam URI and real-time blacklists (SURBL/RBL)

Newsletter (grey mail) and suspicious newsletter detection

PDF Scanning and image analysis

Block/safe lists at global, domain, and user levels

Support for enterprise sender identity standards:

- Sender Policy Framework (SPF)
- Domain Keys Identified Mail (DKIM)
- Domain-Based Message Authentication (DMARC)

Flexible action and notification profiles

Multiple system and per-user self-service quarantines

See id. at 7 (underlining added).

82. Thus, to the extent the preamble of claim 15 is limiting, the '892 Accused Instrumentalities meet it.

83. Limitation A of claim 15 requires “determining an identity relating to a person, wherein the identity is associated with the electronic document.” The '892 Accused Instrumentalities also meet all the requirements of limitation A of claim 15. For example, for each connecting SMTP client (sometimes called the sender), the Sender reputation feature records the sender IP address in the sender reputation database:

Check	Check Involves	Action If Positive	Action If Negative
Client initiates communication with the FortiMail unit			
Sender reputation	Client IP address	If the client IP is in the sender reputation database, check the score and enable any appropriate restrictions, if any.	<u>Add the IP address to the sender reputation database</u> and keep a reputation score based on the email received.

See Exhibit G, FortiMail Administration Guide at 26, 140 (underlining added).

84. Therefore, the '892 Accused Instrumentalities meet limitation A of claim 15.

85. Limitation B of claim 15 requires “determining that the person is a member of a group, wherein the group is associated with a group-related service and wherein the group is associated with a group reputation.” The '892 Accused Instrumentalities also meet all the requirements of limitation B of claim 15. For example, if the FortiGuard IP Reputation feature is enabled, FortiMail will query the FortiGuard Antispam service to determine if the SMTP client’s public IP address is blocklisted. See Exhibit G, FortiMail Administration Guide at 420. FortiGuard further categorizes the blockedlisted IP addresses into three levels of reputation:

To configure FortiGuard scan options

1. When configuring an antispam profile, select the FortiGuard check box in the AntiSpam Profile dialog.
2. From Action, select the action profile that you want the FortiMail unit to use if the FortiGuard Antispam scan finds spam email. This action is the default action for all the FortiGuard filters, including IP reputation, URL filter, and spam outbreak protection.
For more information, see [Configuring antispam action profiles on page 429](#).
3. If you want the FortiMail unit to query the FortiGuard Antispam service to determine if the public IP address of the SMTP client is blocklisted, enable IP Reputation. If the SMTP client IP address is a private one, the FortiMail unit will query the FortiGuard Antispam service to determine if the first public IP address in the header is blocklisted. FortiGuard categorizes the blocklisted IP addresses into three levels – level 1 has the worst reputation, level 2 has better reputation, and level 3 has even better reputation. To help prevent false positives, you can choose to take different actions towards different IP reputation levels. Usually you should take strict actions, such as reject or discard, towards level 1 IP addresses while take loose actions, such as quarantine or tag, towards level 3 IP addresses. Using default actions for level 1, 2, and 3 means to use the IP Reputation action; using the default action for IP reputation means to use the FortiGuard action; and using the FortiGuard default action means to use the antispam profile action.

If you want to check all SMTP servers in the `Received:` lines of the message header, enable the Extract IP from Received Header option.

See id. (underlining added).

86. Therefore, the '892 Accused Instrumentalities meet limitation B of claim 15.

87. Limitation C of claim 15 requires “determining an identity reputation, wherein the identity reputation is associated with the identity and wherein the identity reputation is based at least in part on the group reputation.” The '892 Accused Instrumentalities also meet all the requirements of limitation C of claim 15. For example, FortiMail calculates a sender reputation score:

Viewing the sender reputation statuses

GUI item	Description
Search (button)	Click to filter the displayed entries. For more information, see Filtering sender reputation score entries on page 141 .
IP	The IP address of the SMTP client.
Location	Lists the GeolP locations/country names.
<u>Score</u>	<u>The SMTP client's current sender reputation score.</u>
State	Lists the action that the sender reputation feature is currently performing for delivery attempts from the SMTP client. <ul style="list-style-type: none"> • <i>Score controlled</i>: The action is determined by comparing the current Score value to the thresholds in the session profile.
Last Modified	Lists the time and date the sender reputation score was most recently modified.

Sender reputation is a predominantly automatic antispam feature, requiring little or no maintenance. For each connecting SMTP client (sometimes called a sender), the sender reputation feature records the sender IP address and the number of **good** email and **bad** email from the sender.

In this case, bad email is defined as:

- Spam
- Virus-infected
- Unknown recipients
- Invalid DKIM
- Failed SPF check

The sender reputation feature calculates the sender's current reputation score using the ratio of good email to bad email, and performs an action based on that score.

See Exhibit G, FortiMail Administration Guide at 140 (underlining added).

88. Therefore, the '892 Accused Instrumentalities meet limitation C of claim 15.

89. Limitation D of claim 15 requires “determining a document reputation, wherein

determining the document reputation uses the identity reputation.” The ’892 Accused Instrumentalities also meet all the requirements of limitation D of claim 15. For example, to determine which action the FortiMail unit will perform after it calculates the sender reputation score, the FortiMail unit compares the sender reputation score to three configurable score thresholds:

To determine which action the FortiMail unit will perform after it calculates the sender reputation score, the FortiMail unit compares the score to three score thresholds which you can configure in the session profile:

1. **Throttle client at:** For scores less than this threshold, senders are allowed to deliver email without restrictions. For scores greater than this threshold but less than the temporary fail threshold, senders are rate-limited in the number of email messages that they can deliver per hour, expressed as either an absolute number or as a percentage of the number sent during the previous hour. If a sender exceeds the limit and keeps sending email, the FortiMail unit will send temporary failure codes to the sender. See descriptions for *Temporary fail* in [Configuring sender reputation options on page 399](#).
2. **Temporarily fail:** For scores greater than this threshold but less than the reject threshold, the FortiMail unit replies to senders with a temporary failure code, delaying delivery and requiring senders to retry later when their score is reduced.
3. **Reject:** For scores greater than this threshold, the FortiMail unit replies to senders with a rejection code.

See Exhibit G, FortiMail Administration Guide at 140-141.

90. Therefore, the ’892 Accused Instrumentalities meet limitation D of claim 15.

91. Accordingly, on information and belief, the ’892 Accused Instrumentalities meet all the limitations of, and therefore infringe, at least claim 15 of the ’892 patent.

92. As a result of Fortinet’s infringement of the ’892 patent, K.Mizra has suffered and continues to suffer substantial injury and is entitled to recover all damages caused by Fortinet’s infringement to the fullest extent permitted by the Patent Act, together with prejudgment interest and costs for Fortinet’s wrongful conduct.

PRAYER FOR RELIEF

WHEREFORE, K.Mizra respectfully requests judgment against Fortinet as follows:

A. That the Court enter judgment for K.Mizra on all causes of action asserted in this Complaint;

B. That the Court enter judgment in favor of K.Mizra and against Fortinet for monetary damages to compensate it for Fortinet's infringement of the Patents-in-Suit pursuant to 35 U.S.C. § 284, including costs and prejudgment interest as allowed by law;

C. That the Court enter judgment in favor of K.Mizra and against Fortinet for accounting and/or supplemental damages for all damages occurring after any discovery cutoff and through the Court's entry of final judgment;

D. That the Court adjudge Fortinet's infringement of the Patents-in-Suit to be willful dated from the filing of this Complaint.

E. That the Court enter judgment that this case is exceptional under 35 U.S.C. § 285 and enter an award to K.Mizra of its costs and attorneys' fees; and

F. That the Court award K.Mizra all further relief as the Court deems just and proper.

JURY DEMAND

K.Mizra requests that all claims and causes of action raised in this Complaint against Fortinet be tried to a jury to the fullest extent possible.

Date: July 8, 2021
