7. Description of the project (3000 characters limit)

   MOSAiC is the first year-around expedition with the focus to explore the coupled climate system in the central Arctic under melting sea ice conditions. The implementation of the expedition is based on the German research icebreaker Polarstern that will drift with the sea ice from the Siberian sector of the Arctic across the Central Arctic towards the Atlantic. The focus of MOSAiC lies on in-situ observations of the climate processes that couple the atmosphere, ocean, sea ice, bio-geochemistry and ecosystem. MOSAiC could lead to a breakthrough in our understanding of the main mechanisms acting in the coupled Arctic climate system and its representation in regional and global climate models as well as help to improve weather forecast models. The results of MOSAiC will enhance our understanding of the regional and global consequences of Arctic sea ice loss and connected climate change as well as improve weather forcasts and climate projections. As such it will support safer maritime and offshore operations, and improve science-based decision-making and policy development. Improved understanding of the impact of Arctic climate change on a Northern hemispheric scale will provide stakeholders and decision-makers with the necessary knowledge for adapting to climate change and develop target oriented mitigation strategies.
