   Japanese researchers have been conducting in situ field observations in Northwest Greenland to quantify changes of the glaciers and ice sheet and their interactions with the ocean.

7. Description of the project (3000 characters limit)

   The project has been conducting in situ field observations in northwestern Greenland in order to quantify the changes of glaciers and the ice sheet, and to study their interaction with the ocean. Furthermore, it has organized a workshop with local people in Qaanaaq. Qaanaaq is inhabited by 600 people and they are living on a Greenlandic traditional way of life, such as hunting animals and fishing using dog sledges on sea ice. These activities are now affected by drastically changing natural environments. The project also conducted humanistic field study for the local people to understand what kind of effect such natural change has on their life and society. The aim of the workshop was to introduce Japanese research activities, report study results, learn from the locals the impact of climate change on human society, and discuss sustainable future of Qaanaaq. The goal of the project is to provide the indigenous people in Qaanaaq useful information for their activity. Accurate data on changing glaciers and the ocean should help them to adjust their life to the changing environment.
