SwissBiogas.com presents:

EG 1118 desulfurisation and gas booster additive

# SwissBiogas.com

Additives for Desulfurisation in Anaerobic Digestion

Autark Investments and Projects AG  
Dept. SwissBiogas.com  
Baarerstrasse 75, CH-6300 Zug  
Switzerland

[www.swissbiogas.com](http://www.swissbiogas.com)

## Desulfurisation, why?

- Protects the CHP unit
- Protects the engines
- Raises the efficiency of the whole plant
- Lowers the operating costs
- Increases the operational safety

## Current desulfurisation methods:

- No reactor intervention
- Air injection
- FeCl<sub>x</sub> (ferrous / ferric chloride) addition
- Iron oxide-hydroxide addition
- FeO<sub>x</sub> addition

## Air injection, why not:

- Atmospheric nitrogen is unnecessarily added to the biogas (Ammonia)
- Excessive introduction of oxygen leads to formation of corrosive Sulfurous Acid
- % O<sub>2</sub> higher than 0.9% before CHP has a negative effect on efficiency of CHP
- Sulfur deposits formed in the fermenter gas compartment break off from time to time and drop into the substrate
- Risk of explosion
- Increased corrosion:  $S + O_2 + H_2O \rightarrow H_2SO_4$
- The air flow should be controlled and adapted regularly:
  - a) Less gas production but same air injection results in too much O<sub>2</sub> and dilution
  - b) Higher gas production with same air injection results in too less O<sub>2</sub> with weak desulfurization effect

## FeCl<sub>x</sub>, why not:

- Forms HCl which penetrates the bacterial membrane
- Classified as dangerous substance
- Considered a corrosive substance
- Releases chlorides during desulfurisation → More corrosive than H<sub>2</sub>S

**CORROSIVE**

**IRRITANT**

## Iron oxide-hydroxide, why not:

- **Iron oxide-hydroxide binds metals.**

These materials are known to bind a wide range of other compounds from water, including trace metals, arsenic, selenium, silicate, and organics. Metals such as manganese, cobalt, nickel, and zinc are known to bind to iron oxide hydroxide in simulated seawater solutions. It has also been claimed that the binding of copper and zinc by natural iron oxide hydroxide sediments exerts a powerful control on the concentration of copper and zinc in polluted rivers and estuaries. Although not studied in seawater, it has also been observed that phosphate binding by iron oxide hydroxide actually increases its binding of copper, cadmium, and nickel in freshwater.

## FeOx, why yes:

- Lowers H<sub>2</sub>S very effectively
- Increases methane production
- Prevents corrosion of plant and CHP

## What happens (inside the reactor):

## Comparison of desulfurisation methods, EGx by SwissBiogas.com against others:

# SwissBiogas.com

Additives for Desulfurisation in Anaerobic Digestion

Autark Investments and Projects AG  
Dept. SwissBiogas.com  
Baarerstrasse 75, CH-6300 Zug  
Switzerland

[www.swissbiogas.com](http://www.swissbiogas.com)

## How we pack and ship:

Delivered in powder form, in

- 20 kg bags, or as per
- individual requirements

Please contact your agent for availability.

## 2017 test results by specific waste category: *Kitchen Waste*

- Additive: EG 1117
- Duration: 51 days

### Increase of methane production overall:

- Average: 13.5%
- High: 19.3%

### Increase rate of methane production per unit VS:

- Average: 16.3%
- High: 23.2%

### Speeding up of fermentation rate; Peak of daily methane production:

- Average w/o additive: Day 13, 183.1 ml/day
- Average w/ additive: Day 10, 200.5 ml/day
- High: Day 10, 206.7 ml/day

Remark: All results above achieved **within 43 days!**
