Desulphurisation, why?

- Protects the CHP unit
- Protects the engines
- Raises the efficiency of the whole plant
- Lowers the operating costs
- Increases the operational safety

Current desulphurisation methods:

- No reactor intervention
 - Air injection
- Addition of
- Ferric chloride, FeCl_3
 - Iron oxide-hydroxide, $\text{FeO}(\text{OH})$
 - Iron oxide, Fe_xO_y

Air injection, why not:

- Impairs fermentation and methane generation (Hinge 2014)
- Atmospheric nitrogen is unnecessarily added to the biogas (Ammonia)
- Excessive introduction of oxygen leads to formation of corrosive sulphurous acid
- % O₂ higher than 0.9% before CHP has a negative effect on efficiency of CHP
- Sulphur deposits formed in the fermenter gas compartment break off from time to time and drop into the substrate
- Risk of explosion
- Increased corrosion: $S + O_2 + H_2O \rightarrow H_2SO_4$
- The air flow should be controlled and adapted regularly:
 - a) Less gas production but same air injection results in too much O₂ and dilution
 - b) Higher gas production with same air injection results in too less O₂ with weak desulphurisation effect

Ferric chloride, why not:

- Reduces volume of produced biogas (12% - 32%)
(Dentel 1982, Johnson 2003, Smith 2008, 2009, Dauknys 2011)
- Forms HCl which penetrates the bacterial membrane
- Classified as dangerous substance
- Considered a corrosive substance
- Releases chlorides during desulphurisation → More corrosive than H₂S

CORROSIVE

IRRITANT

Iron oxide-hydroxide, why not:

- **Iron oxide-hydroxide binds metals.**

These materials are known to bind a wide range of other compounds from water, including trace metals, arsenic, selenium, silicate, and organics. Metals such as manganese, cobalt, nickel, and zinc are known to bind to iron oxide hydroxide in simulated seawater solutions. It has also been claimed that the binding of copper and zinc by natural iron oxide-hydroxide sediments exerts a powerful control on the concentration of copper and zinc in polluted rivers and estuaries. Although not studied in seawater, it has also been observed that phosphate binding by iron oxide-hydroxide actually increases its binding of copper, cadmium, and nickel in freshwater.

Iron oxide, why yes:

- Measurably reduces struvite formation
- Lowers H_2S very effectively
- Increases methane production
- Prevents corrosion of plant and CHP
- Reduces HRT

Comparison of desulphurisation methods, SBGx by SwissBiogas.com against others:

	<i>SBGx</i>	<i>Iron Oxide</i>	<i>Iron Oxide-Hydroxide</i>	<i>Iron Chloride</i>	<i>Air Injection</i>

Calculation of the Reactive Iron Ion Content (RIIC)

The most significant and differentiating factor of any Fe-based additive is its Reactive Iron Ion Content (RIIC; Higher = Better). RIIC is a metric, introduced and used by SwissBiogas.com, to reliably project the potential of additives to bind sulphur and to support the growth of methanogens. Based on the RIICs of its respective iron compounds, the RIIC of any additive can be calculated as follows:

- $RIIC(FeO) = 0.7773 \rightarrow RIIC(Additive) = \text{Content FeO [\%]} \times 0.7773$
- $RIIC(Fe_2O_3) = 0.6994 \rightarrow RIIC(Additive) = \text{Content Fe}_2O_3 [\%] \times 0.6994$
- $RIIC(Fe_3O_4) = 0.7236 \rightarrow RIIC(Additive) = \text{Content Fe}_3O_4 [\%] \times 0.7236$
- $RIIC(FeCl_2) = 0.4406 \rightarrow RIIC(Additive) = \text{Content FeCl}_2 [\%] \times 0.4406$
- $RIIC(FeCl_3) = 0.3443 \rightarrow RIIC(Additive) = \text{Content FeCl}_3 [\%] \times 0.3443$
- $RIIC(FeO(OH)) = 0.6285 \rightarrow RIIC(Additive) = \text{Content FeO(OH) [\%]} \times 0.6285$
- $RIIC(Fe(OH)_2) = 0.6215 \rightarrow RIIC(Additive) = \text{Content Fe(OH)}_2 [\%] \times 0.6215$
- $RIIC(Fe(OH)_3) = 0.5226 \rightarrow RIIC(Additive) = \text{Content Fe(OH)}_3 [\%] \times 0.5226$
- $RIIC(Fe_2O_3 \cdot 3H_2O) = 0.5226 \rightarrow RIIC(Additive) = \text{Content Fe}_2O_3 \cdot 3H_2O [\%] \times 0.5226$

Examples:

1. Additive X: 73% FeO(OH) $\rightarrow RIIC(Additive X) = 73\% \times 0.6285 = 45.9\%$
2. Additive Y: 40% FeCl₃ $\rightarrow RIIC(Additive Y) = 40\% \times 0.3443 = 13.8\%$
3. Additive Z: 10% FeO + 20% Fe₂O₃ + 45% FeO(OH) \rightarrow
 $RIIC(Additive Z) = 10\% \times 0.7773 + 20\% \times 0.6994 + 45\% \times 0.6285 = 50.0\%$

Remark: RIIC(SBGx) > 60%

The components of SBGx as base
before individual adjustments to
customers' requirements

Note: The industry-leading high
content of reactive Fe ions > 60%

<i>SBGx</i>	<i>[%]</i>
FeO	> 35
Fe ₂ O ₃	> 35
MnO	< 1.0
CaO	< 0.5
Al ₂ O ₃	< 0.5
MgO	< 0.5
Cr ₂ O ₃	< 0.2
Zn	< 0.1
Cu	< 0.1
NiO	< 0.1
