

SwissBiogas.com presents:
SBGx desulphurisation and gas booster additive

Desulphurisation, why?

- Protects the CHP unit
- Protects the engines
- Raises the efficiency of the whole plant
- Lowers the operating costs
- Increases the operational safety

Common desulphurisation methods:

- Filters, no reactor intervention
- Air injection
- Use of one or a combination of the most commonly used additives:
 - Iron(II) / (III) / (II,III) oxide: FeO / Fe_2O_3 / Fe_3O_4
 - Iron(II) / (III) chloride: FeCl_2 / FeCl_3
 - Iron(III) oxide-hydroxide: FeO(OH)
 - Iron(II) / (III) hydroxide: Fe(OH)_2 / Fe(OH)_3
 - Iron(III) oxide trihydrate: $\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$
- Note: Iron(II) = Ferrous; Iron(III) = Ferric
- For each of the additives and their combinations listed above, SBG's *RIIC calculator* can evaluate the respective *reactive iron ion content* plus *H₂S reduction ratio* and compare them with that of SBGx.

Air injection, why not:

- Impairs fermentation and methane generation (Hinge 2014)
- Atmospheric nitrogen is unnecessarily added to the biogas (Ammonia)
- Excessive introduction of oxygen leads to formation of corrosive **sulphuric acid**:
 $2\text{O}_2 + \text{H}_2\text{S} \rightarrow \text{H}_2\text{SO}_4$ instead of $\text{O}_2 + 2\text{H}_2\text{S} \rightarrow 2\text{S}\downarrow + 2\text{H}_2\text{O}$ [1], [2]
- % O₂ higher than 0.9% before CHP has a negative effect on efficiency of CHP
- Sulphur deposits formed in the fermenter gas compartment break off from time to time and drop back into the fermenter liquid
- Risk of explosion
- The air flow must be controlled and adapted regularly:
 - a) Less gas production but same air injection results in too much O₂ and dilution
 - b) Higher gas production with same air injection results in too less O₂ with weak desulphurisation effect

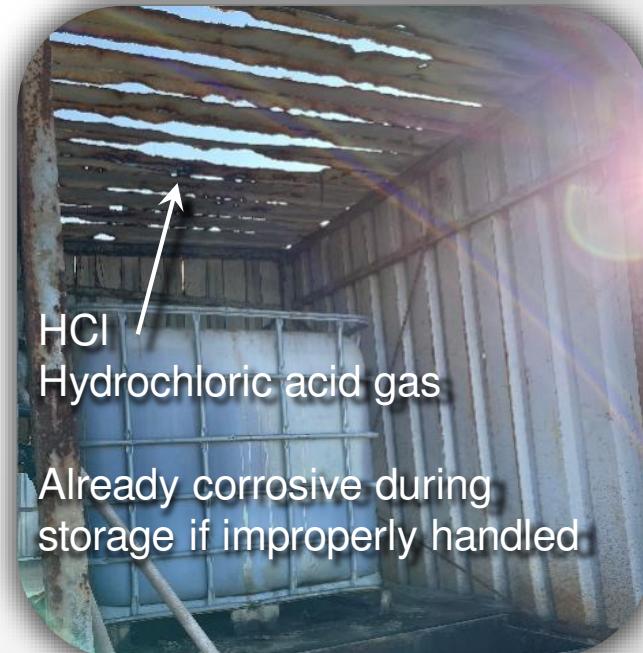

Iron(II)/(III) chloride, why not:

- Reduces volume of produced biogas (12% - 32%)
(Dentel 1982, Johnson 2003, Smith 2008, 2009, Dauknys 2011)
- Releases chlorides during desulphurisation → More corrosive than H₂S
- Forms **hydrogen chloride** which penetrates the bacterial membrane
- Classified as dangerous substance
- Considered a corrosive substance
- FeCl₂ + H₂S → FeS↓ + 2HCl
- 2FeCl₃ + 3H₂S → 2FeS↓ + S↓ + 6HCl

CORROSIVE

IRRITANT

Iron(III) oxide-hydroxide, why not:

- **Iron oxide-hydroxide binds metals.**

These materials are known to bind a wide range of other compounds from water, including trace metals, arsenic, selenium, silicate, and organics. Metals such as manganese, cobalt, nickel, and zinc are known to bind to iron oxide hydroxide in simulated seawater solutions. It has also been claimed that the binding of copper and zinc by natural iron oxide-hydroxide sediments exerts a powerful control on the concentration of copper and zinc in polluted rivers and estuaries. Although not studied in seawater, it has also been observed that phosphate binding by iron oxide-hydroxide actually increases its binding of copper, cadmium, and nickel in freshwater.

Side note: Iron(II) sulphate (“Grünsalz”), why not:

- **Wikipedia (DE):** “Eisen(II)-sulfat (auch Ferrosulfat, *Grünsalz*, ...”
- **Iron fertiliser hazards**
According to the [German] ARD magazine, iron fertiliser is recommended in many specialist shops as a remedy against moss in the lawn. However, they do not mention the sometimes serious side effects and other dangers of the fertiliser. This is because iron fertiliser contains the *highly toxic active ingredient iron(II) sulphate* [FeSO_4]. When it comes into contact with water or other liquids, it produces gases or **sulphuric acid**, which can irritate the skin, eyes and respiratory tract. In the worst case, the **sulphuric acid** has a corrosive effect on the skin. Because of these dangers, the packaging of the iron fertiliser also points out the *need for appropriate protective clothing*.

- $\text{FeSO}_4 + \text{H}_2\text{S} \rightarrow \text{FeS}\downarrow + \text{H}_2\text{SO}_4$ or $\text{FeSO}_4 + \text{H}_2\text{O} \rightarrow \text{FeO} + \text{H}_2\text{SO}_4$ See article above.

Iron(II)/(III) oxide, why yes:

- Measurably reduces struvite formation
- Lowers H₂S very effectively
- Increases methane production
- Prevents corrosion of plant and CHP
- Reduces HRT
- Chemical equations:
 - Ferrous oxide: FeO + H₂S → FeS↓ + H₂O
 - Ferric oxide: Fe₂O₃ + 3H₂S → 2FeS↓ + S↓ + 3H₂O

Sources: [1] Fe²⁺ + S²⁻ → FeS↓
[2] 2Fe³⁺ + 3S²⁻ → 2Fe²⁺ + 2S²⁻ + S↓ → 2FeS↓ + S↓

Comparison of desulphurisation methods, SBGx by SwissBiogas.com against others:

v1.14	SBGx	Iron Oxide	Iron Oxide-Hydroxide	Iron Chloride	Air Injection
<i>Investment into</i>					
Storage and Handling	outside, low	covered, low	covered, low	covered, high	not applicable

Shelf Life	> 12 months	> 12 months	< 12 months	< 12 months	n. a.
Price per chem. Reaction	medium	high	medium	high	n. a.

Anecdotally, highly toxic iron(II) sulphate, aka "Grünsalz" in German, can also be used as an additive: $\text{FeSO}_4 + \text{H}_2\text{S} \rightarrow \text{FeS}\downarrow + \text{H}_2\text{SO}_4$

^A IUPAC: Hydrogen chloride, other name: Hydrochloric acid gas

^B IUPAC: Sulfuric acid

Calculation of the Reactive Iron Ion Content (RIIC)

The most significant and differentiating factor of any Fe-based additive is its Reactive Iron Ion Content (RIIC; Higher = Better). RIIC is a metric, introduced and used by SwissBiogas.com, to reliably project the potential of additives to bind sulfur and to support the growth of methanogens. Based on the RIICs of its respective iron compounds, the RIIC of any additive can be calculated as follows:

• RIIC(FeO)	= 0.7773 → RIIC(FeO additive)	= Content FeO [%]	x 0.7773
• RIIC(Fe ₂ O ₃)	= 0.6994 → RIIC(Fe ₂ O ₃ additive)	= Content Fe ₂ O ₃ [%]	x 0.6994
• RIIC(Fe ₃ O ₄)	= 0.7236 → RIIC(Fe ₃ O ₄ additive)	= Content Fe ₃ O ₄ [%]	x 0.7236
• RIIC(FeCl ₂)	= 0.4406 → RIIC(FeCl ₂ additive)	= Content FeCl ₂ [%]	x 0.4406
• RIIC(FeCl ₃)	= 0.3443 → RIIC(FeCl ₃ additive)	= Content FeCl ₃ [%]	x 0.3443
• RIIC(FeO(OH))	= 0.6285 → RIIC(FeO(OH) additive)	= Content FeO(OH) [%]	x 0.6285
• RIIC(Fe(OH) ₂)	= 0.6215 → RIIC(Fe(OH) ₂ additive)	= Content Fe(OH) ₂ [%]	x 0.6215
• RIIC(Fe(OH) ₃)	= 0.5226 → RIIC(Fe(OH) ₃ additive)	= Content Fe(OH) ₃ [%]	x 0.5226
• RIIC(Fe ₂ O ₃ ·3H ₂ O)	= 0.5226 → RIIC(Fe ₂ O ₃ ·3H ₂ O additive)	= Content Fe ₂ O ₃ ·3H ₂ O [%]	x 0.5226

Examples:

1. Additive X: 60% FeO → RIIC(Additive X) = 60% x 0.7773 = 46.6%
2. Additive Y: 40% FeCl₃ → RIIC(Additive Y) = 40% x 0.3443 = 13.8%
3. Additive Z: 10% FeO + 20% Fe₂O₃ + 45% FeO(OH)
→ RIIC(Additive Z) = 10% x 0.7773 + 20% x 0.6994 + 45% x 0.6285 = 50.0%

Remark: RIIC(SBGx) > 60% (Analysis March 2023)

Comparison table of chemical equations with different iron based additives:

Desulphurisation agent	RIIC [%]	Chemical equation			
Iron(II) oxide	SBGx	77.73	FeO	+ H ₂ S →	FeS↓ + H ₂ O
Iron(III) oxide	SBGx	69.94	Fe ₂ O ₃	+ 3H ₂ S →	2FeS↓ + S↓ + 3H₂O
Iron(II,III) oxide		72.36	Fe ₃ O ₄	+ 4H ₂ S →	3FeS↓ + S↓ + 4H₂O
Iron(II) chloride		44.06	FeCl ₂	+ H ₂ S →	FeS↓ + 2HCl^A
Iron(III) chloride		34.43	2FeCl ₃	+ 3H ₂ S →	2FeS↓ + S↓ + 6HCl
Iron(III) oxide-hydroxide		62.85	2FeO(OH)	+ 3H ₂ S →	2FeS↓ + S↓ + 4H₂O
Iron(II) hydroxide		62.15	Fe(OH) ₂	+ H ₂ S →	FeS↓ + 2H₂O
Iron(III) hydroxide		52.26	2Fe(OH) ₃	+ 3H ₂ S →	2FeS↓ + S↓ + 6H₂O
Iron(III) oxide trihydrate		52.26	Fe ₂ O ₃ ·3H ₂ O	+ 3H ₂ S →	2FeS↓ + S↓ + 6H₂O

Also worth listing: Biological desulphurisation

O ₂ addition dosed correctly	O ₂	+ 2H ₂ S →	2S↓ + 2H₂O
O ₂ addition overdosed	2O ₂	+ H ₂ S →	H₂SO₄^B

Side note: Grünsalz

Iron(II) sulphate	36.76	FeSO ₄	+ H ₂ S →	FeS↓ + H₂SO₄
-------------------	-------	-------------------	----------------------	-------------------------------------------
