STRUCTURAL STEEL  
I-BEAM RACKING SYSTEMS

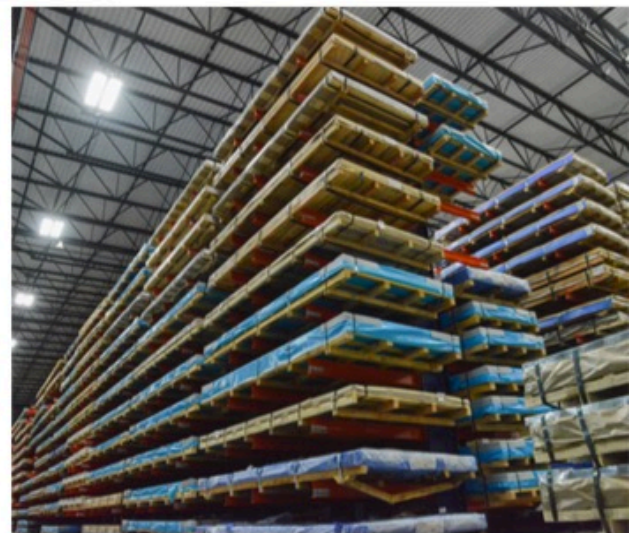

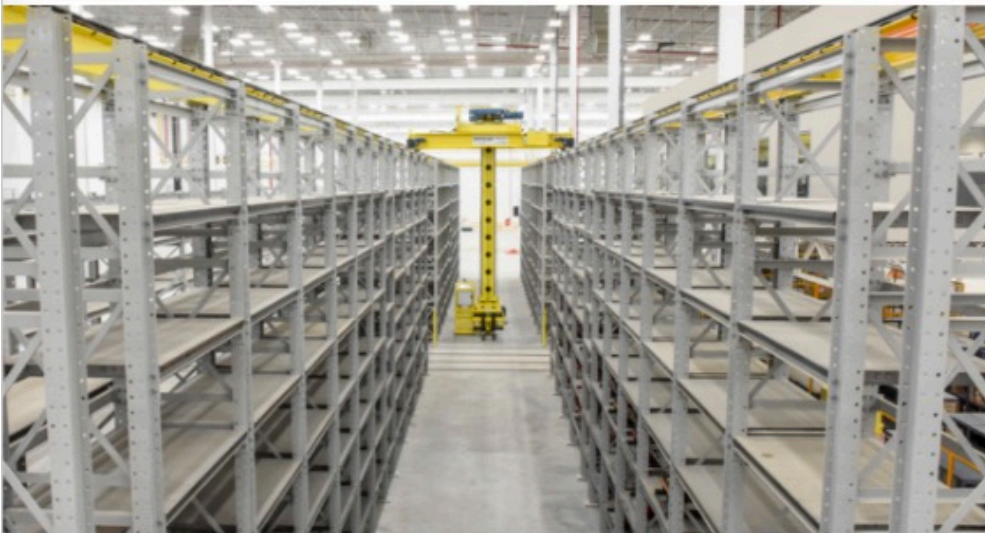

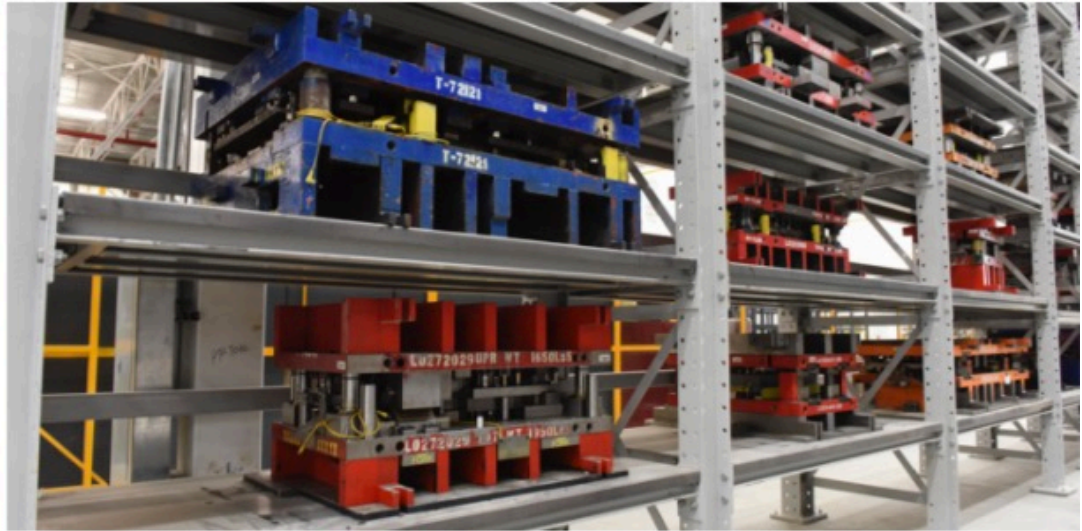

Dexco Racking Systems are engineered to American Institute of Steel Construction (AISC) standards, which were developed for heavy-duty structural steel construction such as bridges and buildings. All rack arms and columns are hot-rolled structural steel (I-beam) manufactured from 50 KSI material, offering much greater strength than roll-formed steel. As a result, our racks better resist damage from material handling equipment and provide larger load capacity within a given space.
