SEATTLE, WASHINGTON, March 1, 1919.

To His Excellency, Louis F. Hart, Acting Governor of Washington:

SIR: In accordance with the provisions of Section 2 of the Game and Game Fish Code, I have the honor to submit herewith the Third Biennial Report of the State Game Warden for the two-year period from March 1, 1917, to February 28, 1919.

Respectfully submitted,

L. H. DARWIN,
State Game Warden.

THIRD BIENNIAL GAME REPORT

To His Excellency, Louis F. Hart, Acting Governor of Washington:

During the period covered by this report, the United States has been engaged in the most tremendous war of history. While many of the states suffered a depletion of population owing to war time conditions, by reason of the enormous war industries which came into existence in Washington, our population increased instead of decreasing. The increase was particularly noticeable in the water-front cities of Puget Sound, Grays Harbor and Willapa Harbor. The natural tendency of war conditions was, as a rule in other countries and in other of our own states, to decrease the artificial propagation of game birds and game fish.

The question of whether to try to continue the propagation of game fish and game birds on a large scale under the war conditions was certainly a perplexing one. Yet, after careful study it appeared to be even the economic thing to do. Our game birds and our game fish furnished not a little of our meat supply and they were non-competitive consumers. The war's greatest drain was upon our supply of animal fats. So it was that after a careful study of the situation from every angle, and a consultation with a number of those who are directly interested in the question in both an official and private way, I decided to carry forward our game bird and game fish propagation work with all the effort which it was possible to put forth.

1918 Surpasses All Records.

And the result, strange as it may seem, was the greatest output of game fish fry during the fiscal year of 1918 ever attained in the history of this State, and the same is true as regards the output of game birds.

During the fiscal year of 1918 the grand total of trout eggs taken at the several hatcheries of this State was 20,239,507 or about twenty-five per cent more than were ever taken in a previous year in the history of the State, and an increase of almost seven hundred per cent over the take of six years previous. During the same year there were hatched at the State Game Farm 3,796 birds, of which 3,242 were Chinese Pheasants. Of this number, 1,921 Chinese Pheasants were reared and liberated or reared and retained as brood stock. Of the construction and operation of the Game Farm, more detail will follow.

The only game fish propagated by the State of Washington is trout. The trout is conceded to be the finest of all game fish and Washington possesses preeminently the finest species of trout to be found anywhere. So highly does the United States Bureau of Fisheries esteem the fishery of Washington that several years since it adopted the policy of refusing to ship into this State any bass or any of the other so-called spiny-rayed varieties of fish, because of the knowledge that these fish are highly detrimental to the higher fish life of Washington. Because our native fish are finer varieties than can be secured elsewhere, we have adhered to the

policy of propagating and planting these in preference to any other except the Eastern Brook trout.

It may be that there are other states which hatch more trout than are produced by the hatcheries of the State of Washington, but if such be the case I have been unable to discover this fact from the reports of the Fish Commissions and Conservation Commissions of the other states of the Union which reach this office, and I have searched them with more or less care.

Our Washington laws arbitrarily class the Steelhead as a salmon, although in reality it is a Rainbow Trout which goes to sea. Our sister Pacific Coast States of Oregon and California class the Steelhead as a trout. If we were to so class them in Washington, our trout egg production of 1918 would have exceeded a total of more than 32,000,000.

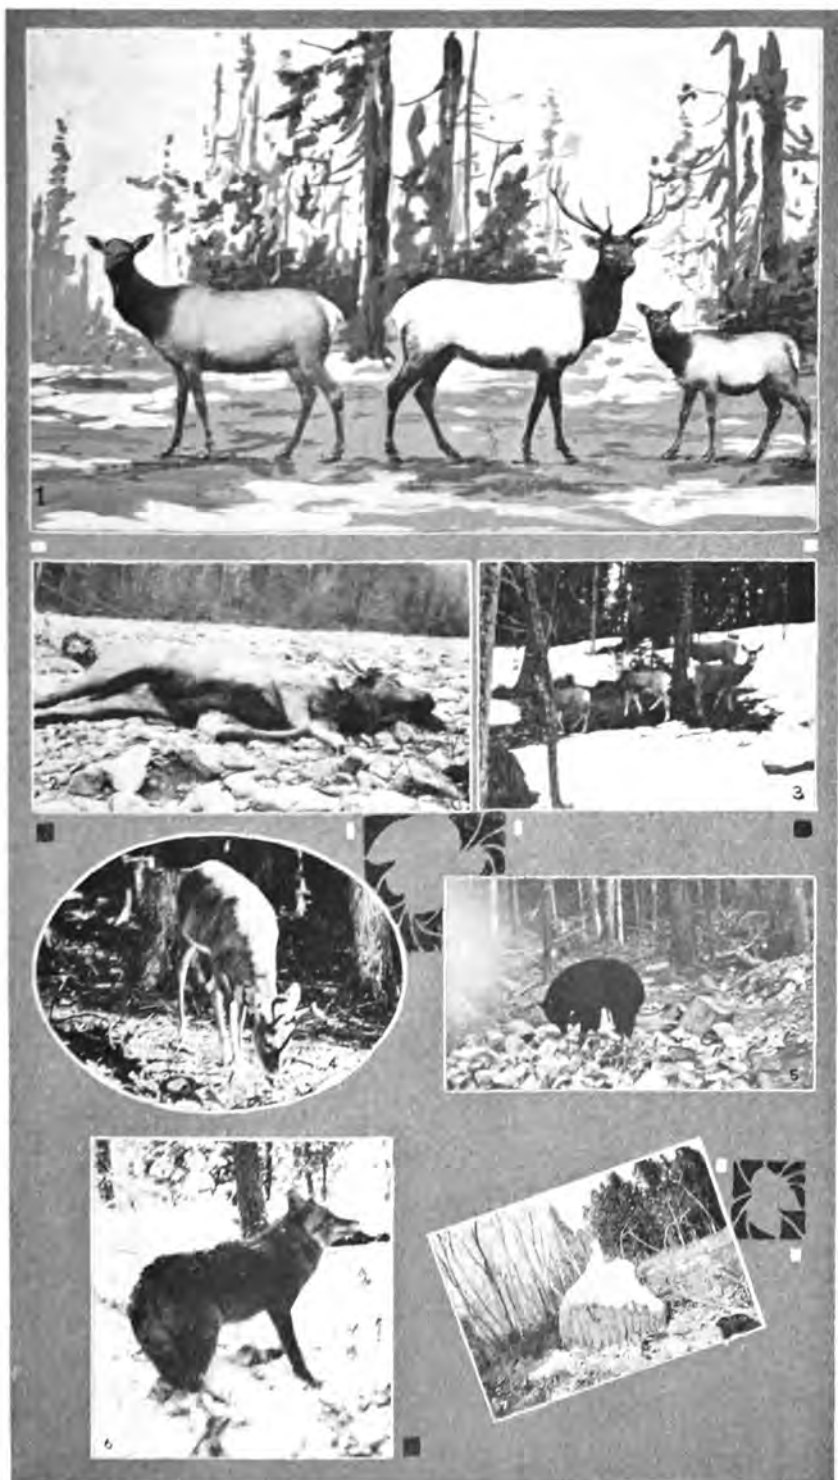

Going to make the total of 32,000,000 is what we have denominated the "Silver" Trout. This species is in reality a land-locked Sockeye Salmon. The peculiarity of the Sockeye Salmon is that it only ascends those streams for spawning purposes which have their source in a lake. At the breaking up of the ice age some 25,000 years ago, when the waters receded and left the outlines of Puget Sound, some of these Sockeye Salmon remained in some of our lakes. The greater number remained in Lake Whatcom in Whatcom County.

Before nature restored a salt water outlet to these lakes, the Sockeye Salmon therein had lost their sea-going instinct. And although for thousands of years they could have reached the salt water had they so desired, they have steadfastly refused to do so. The so-called Silver Trout have various appellations. In some vicinities, notably in King County, they are called "Graylings." In other localities they are referred to as the "Red Trout" or the "Red Fish."

For several years previous to 1917 this Department operated an eyeing station on Lake Whatcom for the taking of Silver Trout eggs. These eggs were distributed to the various hatcheries of the state for hatching and the fry resulting therefrom had been planted in almost every county in the State. While in Lake Whatcom the Silver Trout only attain the average size of nine inches, there are some lakes in the State in which the fry from these have grown to a fish weighing as high as four pounds, while it is not uncommon to find them weighing two and three-fourths pounds. While at first we regarded them strictly as a lake fish, experiments made by planting the Silver Trout in rivers and streams of Walla Walla County disclosed the fact that they thrived exceedingly well in them.

In order to meet the ever increasing demand for these Silver Trout, the Legislature in 1917 appropriated \$7,500.00 for the construction and operation for a two-year period of a trout hatchery on Lake Whatcom for their propagation. Complying with this legislative mandate, we constructed on Lake Whatcom possibly the handsomest and largest trout hatchery in the State. The output from this hatchery in 1918 reached to over 13,000,000 eggs.

The Silver Trout has won first place in the affections of the great majority of those who fish in the State of Washington. Under the laws of our State, children under sixteen years of age and women are not required to have licenses. Nevertheless, together they constitute, I should say, fully

WASHINGTON—THE LAND WHERE THE BIG GAME ABOUND.

fifty per cent of those who fish. And because the Silver Trout is more plentiful and possibly not quite so hard to catch as other trout varieties, they are a great favorite with women and children. Even among the fishermen, a very great majority enthusiastically favor them. From a food standpoint, no finer fish can be found.

Washington Leads All Other States in Trout Hatching.

It is quite a distinction to attain first place in trout production of any State in the Union. I believe that in 1918 Washington attained to this honor. In that year I think its trout production far exceeded that of Oregon and California combined and I believe that it did not fall far short of producing as many trout through artificial propagation as were produced by all the other states west of the Rocky Mountains, and this was all done on an expenditure of only \$11,000.00. It is now being charged in the public press of Oregon that in 1918, on an expenditure of more than \$100,000.00, there were only produced from the trout hatcheries of that State barely 1,000,000 trout fry if Steelhead be excluded. If Steelhead be included, the total reached 3,600,000 in round numbers.

If the statement made in Oregon papers be true that it cost \$100,000.00 to produce these 3,600,000 trout and Steelhead fry combined, it is readily to be seen that if this same ratio of cost and production were maintained in Oregon, it would have cost them \$1,100,000.00 in 1918 to produce the same number of trout and Steelhead fry that were produced in the State of Washington on an expenditure of only \$11,000.00.

In an effort to secure a change in our Game Laws, certain quarters urged upon the last Legislature that we should adopt the Oregon system of administration and propagation as much preferable to our own. However popular the Oregon system may be in some quarters in Washington, it is very apparent that there is more or less dissatisfaction with these laws in the State of Oregon itself. Even before our 1919 session of the Legislature adjourned, a complaint regarding the administration of the Oregon laws had been filed with Governor Olcott of Oregon.

At a public hearing which was held upon these complaints on June 7, 1919, the statement was made by the Master Fish Warden of Oregon that in Oregon in 1918 there was a small trout take as it was a bad year; that in Oregon Steelhead are classed as trout while in the State of Washington we arbitrarily class them as salmon; that the cost of hatching trout in Oregon in 1918 was \$5.00 a thousand; that in 1918 the State of Maine, which was cited approvingly by certain quarters, produced less trout eggs than the State of Oregon; that in Maine the cost of producing one thousand trout eggs in 1918 was \$9.05; that in 1918 the United States Bureau of Fisheries only secured 34 fry out of every 100 eggs taken. In other words the egg loss was 66 per cent.

In view of these statements made at the Oregon investigation conducted by Governor Olcott, it is a source of great satisfaction to this Department to point out that, if we class Steelhead as a trout, in 1918 we produced more than 32,000,000 trout in the State of Washington as against Oregon's 3,600,000; that in Washington in 1918 it cost us less than 35 cents per thousand to hatch our trout fry as against a cost of \$5.00 a thousand in the State of Oregon and \$9.05 a thousand in the State of Maine. In Wash-

ington in 1918 the average loss of strictly trout eggs was only 10 per cent and of our Steelhead eggs 4 per cent, making an average loss of about 7 per cent if both are to be classed as trout. This trout eggs loss of only 7 per cent by the State of Washington certainly compares very favorably with the statement that the Government lost 66 per cent of its Rainbow Trout eggs in 1918 and the Government classes Steelhead as Rainbow Trout.

I am convinced from a perusal of the reports of other Fish and Game Commissioners of the several states of the Union that nowhere are greater efforts being put forth for the propagation of game fish and game birds than in this State, and nowhere is so much being accomplished at so small an expense. While natural conditions may favor Washington in comparison with certain states, the truth of the matter is that there are conditions which we have created here that give us a decided advantage over other states in the matter of production cost. I notice that several of the fish and game commissions and conservation commissions seem to have hundreds of thousands of dollars at their disposal annually for the perpetuation of their game and game fish supply. From their published reports I am unable to discover, even with this vast amount of money available for this purpose, where they are producing anything like the number of game fish fry or game birds that are being produced in this State at a far less outlay. I ascribe this to two things:

The Reason of Our Low Hatchery Cost.

First—In the matter of our game fish propagation we are enabled to make use of the extensive salmon hatchery system which this State possesses. The State of Washington has a total of more fish hatcheries than are possessed by the United States Government within the territory of the United States and Alaska combined. By making use of the salmon hatcheries to hatch our trout, we save ourselves an enormous amount of money. The trout spawn or eggs are collected at the various trout hatcheries or eyeing stations and in the "eyed" stage are transferred in many instances to the county in which the resulting fry are to be liberated. They are placed in one of our salmon hatcheries where the cost of their hatching is nothing, as our salmon hatchery forces are able to do this without any additional expense. Their planting is then effected by this Department or by the County Game Wardens at very little additional expense.

If we were to try to follow the policy of hatching these eggs only at our trout hatcheries it would be a physical impossibility to transport the great quantities of fry which we have to all the counties in the State as we do, even though we were to go to the great expense of purchasing specially constructed railway cars for this purpose. An attempt to even reach the more favorably situated counties would involve an expense which in my estimation would reach \$10.00 for each \$1.00 now expended under the present system. To my mind this alone furnishes sufficient argument why our great hatchery system should remain intact and not be divided as between the food fish interests and the game fish interests. And in this connection permit me to say that insofar as I know, there is only one State in the Union—Maine—where there is a division of the food fish and the game fish departments. Their propagation work as compared with the

grand total of our own is insignificant, and their hatchery costs out of all proportion.

Second—Our game bird propagation is effected at a comparatively small expense because of the fact that our game farm is situated on grounds owned by the State Penitentiary and in the main operated by inmate or convict labor. Of the \$20,000.00 appropriated by the 1917 session of the Legislature for the construction and operation for a two-year period of the State Game Farm, there was approximately \$12,000.00 expended in construction and stocking. During this same period the number of game birds, principally pheasants, and of the Chinese Pheasant variety, which were hatched and liberated or retained as brood stock was 3,945. Now, some of the pheasants produced were of much greater monetary value than others. The most popular variety and the one produced in the largest numbers was the Chinese Pheasant. The price quoted for these is the cheapest of any of the varieties. Quotations per bird which I have received during the last eight months range from \$2.00 to \$3.50. The truth of the matter is that it is almost impossible to secure these birds at all so great is the demand, and the same statement holds true as regards their eggs. This matter I shall discuss further on in connection with the operation of the State Game Farm.

Construction and Operation of State Game Farm.

Five days after the appropriation for the construction of the State Game Farm, on a forty-acre plot of ground belonging to the State Penitentiary at Walla Walla, became available, war was declared with Germany. Very fortunately we had contracted for quite a lot of the necessary materials. Had this not been the case it would have been impossible for us to accomplish nearly as much as we were able to accomplish with the money available. One of the very largest items of expense is something which is not discernible to the person who views the farm. It is the waterworks system. I am glad to take this occasion to publicly thank the City Commissioners of Walla Walla for their liberal attitude in agreeing to donate the necessary water from the city's system for the operation of the farm. This agreement will annually mean the saving of more than \$1,000.00 to the State. In fact with the development of the farm, there may come a time when it will mean the saving of \$2,000.00 or \$3,000.00 a year. This is done without any injury whatsoever to the City of Walla Walla, as the water would otherwise be wasted. We are enabled to accomplish this saving to ourselves without any resultant loss to them by the means of storage reservoir or tank which permits us to store the water at night, during which time the city has a surplus which would otherwise overflow their reservoir and be wasted.

The accompanying illustrations will show what has been accomplished at Walla Walla in the way of construction far beyond my powers of description. There are 3.61 acres of brooding, breeding and rearing pens under wire at this time. In addition we have constructed a comfortable residence for the superintendent and additional buildings necessary for the operation of the farm; such as, chicken houses, storage houses for feed, and necessary general utility buildings. The plans were so made and the work so far has been done along lines so that extensions may be made as they are necessary and as funds are available. A plot of ground that was far from slightly has been made into one of the beauty spots of the State. The front

portion is being made into a regular park, the real purpose being to secure beauty and at the same time screen the pens. A pond has been made in which we are already hatching Mallard Ducks. Trees and shrubbery have been set out and, thanks to the cooperation of Superintendent Henry Drum of the State Penitentiary, we are securing an abundance of flowers from that institution's hothouse.

I believe that in the years to come, the State Game Farm at Walla Walla is going to be one of the most attractive places in the State, and that it is sure to play an important role in maintaining a game bird supply which will permit the State of Washington to compare most favorably in this respect with any other State in the Union. In the construction and operation of the Game Farm it was my pleasure to receive the valued counsel of Superintendent Drum of the Penitentiary and the County Game Commissioners of the State who assembled at Walla Walla in January of 1918. It was a source of great satisfaction to have the Game Commissioners give their unqualified endorsement to the plans which were prepared by this Department.

In making inquiries of the other States, I was greatly surprised to learn that only some ten or eleven of them make any attempt to maintain game farms. In only three states is there attempted artificial propagation such as we are carrying on in Washington. The other states simply maintain game refuges and game sanctuaries where their game animals and game birds are permitted to propagate naturally. It is my very firm conviction that during the fiscal year of 1919 the Washington State Game Farm will produce as many Chinese Pheasants as will be produced by any other game farm in the country.

My investigations also disclosed the fact that the only two game birds of which propagation is attempted on any large scale anywhere are the Chinese Pheasant and the Hungarian Partridge. The Conservation Commission of the State of New York points with pride to the fact that they have been enabled to produce Chinese Pheasants at the average cost of \$2.75 per bird. We hope to make the cost per bird in the State of Washington less than \$1.00 and possibly 50 cents each.

The establishment of the Washington State Game Farm came at a particularly opportune time. A large portion of the world had been at war for almost three years before we commenced its construction. From the moment war was declared in Europe, the importation of game birds from that country abruptly ceased. Prior to that time a large proportion of our game birds, principally Hungarian Partridges, had been secured from Europe. Game bird propagation is much more extensively carried on in that country than in the United States. The result of the cessation of importations is that at the present time for the first time in our history, the Eastern States are looking to the Western States for game birds. The result is that the price of game birds has increased and it is practically impossible today to purchase them, as the dealers have engaged all they can produce for some time to come. It should be a source of great satisfaction to the people of this State—those who shoot as well as those who do not—to know that we prepared ourselves against this shortage so we should be in a position to maintain our game bird supply during the immediately succeeding years when there bids fair to be a scarcity in many

other states; for it is exceedingly doubtful if it will not be some time before Europe is able to resume the exportation of game birds to this country.

The next work of game bird propagation which we expect to take up on a large scale is the Hungarian Partridge. We have been attempting to secure brood stock of these, but so wily are they that they eluded our attempts to trap them during the winter of 1918-1919. We have our arrangements made to secure some eggs from some of the counties during this coming season, and we hope to begin their propagation on a fair scale in 1920.

In addition to the Chinese Pheasant we are hatching Mongolian, Silver, Golden, Reeves, Lady Amherst, Prince of Wales and some other varieties. During the year 1919 we shall liberate some Silver and Golden Pheasants in certain counties of the State to see if they will make a satisfactory game bird. While the success of this experiment is more or less to be doubted, we feel justified in raising a few of these birds for park and show purposes in the State. Very largely our efforts will be at the propagation of Chinese Pheasants and Hungarian Partridges, but will maintain a fair amount of brood stock of the above mentioned varieties of pheasants, and of Mallard Ducks and wild turkeys. The propagation of these other varieties for park and show purposes, to my mind, has an educational value that justifies the expense. It must be borne in mind that all the people of the State pay taxes for the maintenance of the State Penitentiary and they are to be considered in the operation of the State Game Farm as well as those who purchase hunting and fishing licenses and thereby furnish the necessary moneys.

One of the greatest items of expense in the operation of a game farm is labor, and this labor is in large part furnished at the expense of all the people who are taxed for the maintenance of the State Penitentiary. The Legislature now in session has already appropriated moneys for the extension of the Game Farm. More rearing pens will be constructed and a water storage and irrigation system installed in accordance with our agreement with the City Commissioners of Walla Walla at the time they agreed to furnish us a water supply without charge.

This State's example in installing a State Game Farm to be operated by penitentiary labor is being closely watched by several other states with the idea of following our lead if we are successful. Following an inspection by the game authorities of Idaho, they have announced their intention to construct a game farm to be operated in connection with the Boise State Penitentiary.

This much is certainly true, that the output of the State Game Farm is non-competitive. I have yet to hear the first objection from any quarter to the proposition of using penitentiary inmate labor for this purpose. To the contrary the idea seems to appeal to everybody and particularly to those who have made more or less of a study of prison conditions.

The penitentiary inmates view the establishment of the farm most enthusiastically. In its operation only "trusties" are allowed to assist. The inmates consider it quite a favor to be permitted to work thereon and in many instances urge that they be allowed to work long hours and thus escape being shut up within the prison walls. From the humanitarian point

of view, the establishment of the game farm is particularly appealing. This work out in God's free air and sunlight is incomparably better for the unfortunate inmates than labor within the prison walls. Already one of the inmates who has learned bird raising on our game farm and who has been released from the penitentiary, has gone to another state and started a private game farm of his own. On the Washington State Game Farm operated in connection with the State Penitentiary he learned the first vocation he had ever learned in his life.

Mr. L. J. Esses has been superintendent of the Game Farm since the work of construction was started.

Imported Birds Supplanting Our Native Ones.

How many people of this State stop to consider the fact that our principal game birds today are those which have been introduced into the State within the past twenty-five years? I believe that the greatest shooting today is furnished by the Chinese Pheasant, the Hungarian Partridge and the Bob-white Quail. Despite the fact of the increased protection given our native birds, the great increase in the number of hunters has served to prevent any great increase during the last two years. From information which I have at hand, I do not think there has been any depletion during the last two years in our native pheasant, blue grouse and prairie chicken and if anything there may have been a slight increase, but advancing civilization in the way of the increase in our cultivated acreage serves to reduce our prairie chicken. Even though we may sustain further loss of our native birds, we are going to be fully compensated with the Chinese Pheasant, the Hungarian Partridge and the Bob-white Quail.

One of the best provisions in our game law is that enacted by the 1917 session of the Legislature which gives to the County Game Commissioners of the respective counties the right to open, close or shorten the upland bird season when other conditions warrant, conditioned upon receiving the sanction of the State Game Warden. County Game Commissioners are on the ground and are aware of conditions as they arise. Heretofore it has been necessary to await the biennial session of the Legislature to try to secure any change that might be desired in the way of closed seasons in order to save the birds. This new law does away with all of this delay and enables the County Game Commissions to act immediately the occasion arises; and it has certainly been a source of great pleasure to me to observe how quick they have been to take advantage of it. A very large number of the counties are already taking advantage of this excellent provision of the law.

Duck Shooting Best in Years.

The duck shooting during the last two years, particularly in 1918, is admitted by all to have been the best in years. This possibly results in a measure from the mild winters, but I also feel inclined to give due credit to the workings of the Federal Migratory Bird Law.

Deer Increase.

From almost every section of the State come reports of the increase in the number of deer. This results from the beneficial provisions of the game law which protects them, and from the fact that the Game Wardens of the State are enforcing the law.

Good Law Observance and Enforcement.

At no time during the six years that I have been the head of the Game Department has there been so few violations as during the past two years. Nor has there ever been a better enforcement of the law than during the same period. In my judgment this comes from the fact that the Game Commissioners of the several counties of the State have hired Game Wardens with an eye singly to their fitness for the position. Frankly, if partisan interests have entered into the consideration of Game Wardens in any instance, I am not aware of the fact. From the statistics of arrests in this report it will be seen there have been fewer arrests made than in the previous years. May we not express the hope that this has resulted in part from the fact that the people generally have come to a greater understanding of the necessity for observing our game laws?

Game Fish Supply Increasing.

From practically every county in the State comes the information that game fishing conditions are better than ever. The problem of trying to maintain the game fish supply near the great centers of population is a very perplexing one. Let it be admitted that at the opening of the fishing season the waters contain just as many fish as in primeval days. Can any person doubt that this condition could only last a very short time after fishing starts near the great cities like Seattle, Tacoma and Spokane? Just think, in King County alone in the year 1918 there were issued 22,021 licenses. The license holders do not exceed fifty per cent of those who fish, for children under sixteen, and women are not required to have licenses. So it is absolutely safe to assume that in King County alone there were over 44,000 who were fishing in 1918. On top of this great increase in population has come the development of the automobile with its widespread use. Where formerly the average person who fished was inclined to indulge his fondness once or twice a year, by making use of the automobile and of the splendid road system which has been constructed over our State, it is safe to say he will fish ten to twenty times a year now where formerly he fished only once.

To me the great wonder is that fishing conditions continue as good as they do. At the beginning of the fishing season in 1919 the newspapers of Seattle and Tacoma declared that fishing conditions in the vicinity of these two cities were the best in history. Assuming that these newspaper reports were true, and every newspaper carried practically the same statement, the only explanation which can be offered is that the splendid fishing situation is the result of the intensive game fish propagation work which has been carried on by this Department in the last six years and which has resulted in the increase in our trout propagation of seven hundred per cent in 1918 over the year 1912. In the lesser populated sections of the State fishing conditions are declared to be much better than a few years ago and in many places, better than ever before. It is practically the unanimous opinion of the game authorities of the counties that these conditions are the result of the increased planting of fish in recent years. That these statements are true seems fairly certain. The truth of the matter is that the opening of

the fishing season in Washington is from thirty to sixty days in advance of the spawning time of the trout. It is a fact, lamentable but true, that the Fisheries Department of the State of Washington does not secure one egg at our State Trout hatcheries or trout eyeing stations during the so-called closed season for game fish, which is from December 1st to April 1st following. If this State is to secure full advantage of the natural propagation of fish, the opening of the fishing season will have to be deferred until June 1st. To secure the passage of such a law at the present time would be very hard indeed. A few years ago the Legislature fixed the opening of the fishing season at May 1st. Two years following this, however, the opening of the fishing season was moved back to April 1st.

Increased Difficulty of Securing Trout Eggs.

With each passing season we have experienced increasing difficulty in securing trout eggs. Unfortunately there seems to have grown up an antipathy between the residents of the large and small counties—speaking from a population standpoint. The country rather than the city offers the opportunity for fishing. Very naturally the city people want to fish where the fish can be secured, while on the other hand many country people feel that the city people are intolerant of the country people's rights. Mutual courtesy and mutual regard for each other in the majority of instances remove this friction.

But, there is cause for friction that is less easy to remove. The great majority of our trout eggs are secured from the more sparsely populated counties. Many of the residents of these counties resent the eggs being taken away from their waters to be hatched and the fry planted in the waters of the larger counties. Yet, unless the State pursues this policy, in a few years the waters of the larger counties, which are very much more intensely fished, would be entirely denuded.

Any concerted movement, the tendency of which is to arouse the natural feeling of resentment which exists between the larger and smaller counties, is to be highly regretted. It should be borne in mind by all, that the fish are the property of all the people of the State—men, women and children. The mere fact that a person takes out a license to hunt and fish does not give him any proprietorship of the game and game fish of this State. This license is simply to take some of the game and game fish which are the property of all. The fish and game may in all probability have their existence in water and upon lands whose owners never think of taking them, but who nevertheless feel they possess an even greater degree of ownership than persons who come with a license, giving them authority to catch and kill them.

This feeling of game ownership on the part of the country-landed proprietor, when allowed to work to its logical conclusion, results in the same conditions as obtain throughout Europe today and even throughout the Eastern part of the United States where fishing and hunting have practically become a rich man's game. Let us sincerely hope that here in Washington we may escape this. In Washington we want to preserve our great outdoor sports to rich and poor alike. It has been my experience that courtesy will get one much farther than cursing.

During the fiscal year of 1918 the total take of trout eggs in this State was 20,239,507. These were divided by species as follows:

Beardslee	34,000
Crescentil	42,000
Cut-throat	2,996,260
Eastern Brook	1,807,140
Rainbow	1,545,937
Silver	13,914,170
Total.....	20,239,507

The desire of this Department is to greatly increase its take of Cut-throat, Eastern Brook and Rainbow Trout eggs. With the limited funds at our disposal we have gone much farther than could have been reasonably expected. In our Cut-throat and Rainbow Trout we possess the two finest varieties to be found on the American continent. To these have been added, particularly in the Eastern part of the State, the Eastern Brook Trout. To my great surprise in 1918 we secured as many Eastern Brook Trout eggs in this State from this transplanted fish, as were secured by the great State of Pennsylvania.

But, we are hampered in our opportunities to take eggs, because in practically every instance objection is raised if we attempt to close any lakes or streams in order to increase the supply of fish therein and thus increase our egg take. Immediate residents in the vicinity feel they are being deprived of what they consider their rights for the benefit of others who may reside far distant. Yet, in my opinion this must be done if we are to increase the propagation of our native species of trout. Even if it were considered desirable to purchase trout eggs from private hatcheries in the East, it is impossible to do so at the present time, so great is the demand for them. This method is resorted to by the United States Bureau of Fisheries to considerable extent. To my mind the future of our game fish conditions in this State lies in intensive propagation, the setting aside of certain places for the purpose of securing spawn and prohibiting fishing therein, the limiting of the number of fish which may be taken by the individual, and the adoption of closed seasons which will allow the fish to naturally reproduce their species.

One reason why fishing conditions in this State are as good as they are is because of the fact that fish are now to be caught in many waters of the State where there were none prior to the time they were planted therein by our Fisheries Department. There were a great number of lakes in this State that were entirely barren of fish a few years ago, and unless we continue to plant fish therein they would be barren a few years hence, for they possess no appropriate spawning grounds.

Great Increase in Game Bird Supply of San Juan County.

Since the action of the Legislature in passing a law prohibiting the taking of birds out of San Juan County which have been killed therein, the supply has increased tremendously. The group of islands which comprise this county offer exceptional opportunities for game bird propagation. Outside hunters have largely desisted from visiting the islands since the passage of this law, because of their inability to take the birds which they kill home with them. In my opinion the next Legislature can safely raise

the ban for a limited time at least, without doing material injury to the bird supply. I am informed that such action on the part of the Legislature will not be opposed by the Game Commissioners of San Juan County.

Increased Number of Roosevelt Elk in Olympic Peninsula.

From the information which this office has been able to gather, there has been a very substantial increase in the number of elk (the Roosevelt variety) in the Olympic Peninsula since the passage of the law which prevents their killing until the year 1925. So great has this increase been that it is possibly true that in certain of the watersheds a portion of them either starve to death or become so weakened from lack of food that they fall a prey to the rigors of the winters or thereby become easy prey for their natural enemies; such as, the cougar, etc.

The proposition of how to reduce this elk herd is one upon which it is very hard to reach an agreement. The United States Forestry officials who have investigated these elk herds are very much of the opinion that the number should be reduced. Largely because of lack of complete knowledge of the situation, any attempt to permit of the killing of a certain number has encountered so much objection that it has been impossible to have the Legislature modify the law in any particular. And the attempt to do this invariably runs against the obstacle of how to reduce the herd. Some favor the idea of fixing a very high license fee for the privilege of killing an elk. This is met with the objection that to do so would make this exclusively a rich man's sport.

To my mind the best solution lies in permitting the Game Commissions of the counties in which the elk are located, with the consent of the State Game Warden, to kill a certain number if it is found necessary to do so in order to prevent the increase of the herds to a size where starvation threatens all of them. The carcass could be disposed of by the County Game Commission either by giving it to State or county charitable institutions or, if deemed better, by sale of it; the proceeds to be placed in the County and State Game Funds. I think this plan is preferable to one which would limit the killing of the elk to those persons who are financially able to pay a large license fee for the privilege.

But, I further feel that the elk herd should not be depleted unless a thorough examination should disclose that it is in the interest of the whole herd that a certain number should be eliminated.

New Trout Hatchery Replaces Old One at Walla Walla.

Into such ill repair had the Walla Walla Trout Hatchery fallen that it was necessary to replace it in order to permit of its continued operation. The increase in the number of trout eggs available for hatching at this place was so great that the old hatchery was not large enough to accommodate them; so the new hatchery has an increased capacity. One-half of the money for the construction of the new hatchery building and living quarters for the superintendent was donated by the Walla Walla County Game Commission. The new hatchery and living quarters are modern and are constructed in connection with and in continuation of the concrete rearing ponds built at Walla Walla during the preceding biennium.

If a suitable water supply can be obtained, it might be in the interest of economy later on to move the Walla Walla Trout Hatchery onto the State Game Farm grounds. In my opinion if this proves feasible, it certainly should be done, and the development of the next two years should demonstrate as to whether or not it is feasible.

New Lake Whatcom Trout Hatchery Constructed.

The 1917 Session of the Legislature passed a bill appropriating \$7,500.00 for the construction of a trout hatchery on Lake Whatcom for the propagation of Silver Trout. The site for this was donated by the Whatcom County Game Commission for the reason they possessed the most valuable one to be found on Lake Whatcom for the taking of brood fish. This Department has complied with the legislative mandate and erected on Lake Whatcom one of the handsomest and most modern hatcheries to be found in the State, and one which during the fiscal year of 1918 produced over 13,000,000 fry. Its capacity is far in excess of that of any other trout hatchery. It needs to be because many more eggs are secured here than anywhere else in the State.

In connection with the hatchery there was constructed a dock and boat shed and one of the boats which the Fisheries Department seized from Canadian fishermen, who were illegally fishing in our waters, has been turned over to this hatchery for use in connection with its operation.

Game Code Amendments Fail of Passage.

I desire to repeat the assertion heretofore made that the game laws of Washington are the best of those of any State in the Union. Within the past ninety days this statement has been made to me by one of the highest officials of the United States Bureau of Biological Survey, which Bureau is charged with the enforcement of the Federal Migratory Bird Law. I can conceive of no method calculated to give better results than that which has been adopted in Washington to continually better our game laws. Once every year there has been a meeting of the County Game Commissioners and they have carefully gone over the laws and have considered changes for their betterment. Whatever changes the majority have agreed upon as necessary, have been embodied in a bill or bills which have been introduced into the Legislature and which up to the 1919 session have been in the main passed by that body.

In December of 1918 the County Game Commissioners held their annual session and agreed that several changes should be made in the law. The war conditions, existing for two years, had resulted in the increase in the price of everything practically one hundred per cent. It must appeal to every fair-minded person as a self-evident fact that, if the existing law was only yielding sufficient revenues to conduct the Department, unless the revenues were increased the Department could not properly function.

It was agreed that there should be an increase of twenty-five per cent in the cost of county hunting and fishing licenses—raising them from \$1.00 to \$1.25—while the State hunting and fishing licenses were to be increased from \$5.00 to \$7.50. From the general public of the State, interested in game and game fish matters, there was absolutely no protest. Everyone realized that if the supply of game and game fish was to be replenished and

if the game laws were to be enforced that, under the increasing cost of every thing, labor included, more money would be necessary.

The State convention of County Game Commissioners and Game Wardens also adopted a recommendation that hunting and fishing in this State should be limited to citizens of the United States and Canada. The protection afforded the beaver by the present law had resulted in their increase to so great an extent that in many places they were seriously damaging the trees and the crops of the horticulturists and farmers. Likewise the protection given the elk by law had allowed them to become so numerous that they were committing similar depredations.

Under the present law the injured persons have absolutely no recourse. The County Game Commissioners desired the law so amended that the County Game Commissions could pay damages to those persons whose orchards or crops were damaged by the beaver, elk or other animals protected by law; such damages to be paid from the State Game Fund. It is hard to conceive of a fairer measure or one conceived in greater equity or higher spirit of justice.

There were several other almost equally meritorious amendments to the law which were suggested by the State Association of County Game Commissioners and Game Wardens at its December, 1918, session. These were embodied into the bill which was introduced into the 1919 Legislature. The bill passed the Senate by an almost unanimous vote but was never brought to a vote in the House, so failed to become a law.

In King County in 1918 there were issued over 22,000 licenses to hunt and fish. The persons who opposed the bill, which would have given to the State and the several counties the necessary moneys wherewith to restore and perpetuate our game and game fish supply, at the same time professed to be in favor of an intensive artificial propagation policy. Just how this policy was to be carried on without money was not explained.

State Game and Game Fish Department Economically Conducted.

Despite the prevailing war conditions and the increased cost of everything going into the work of artificial propagation, the Department's record for economy of operation during 1917 and 1918 will stand out for many years to come as a singular achievement. The total appropriation for the biennium for the repairs to the trout hatcheries of the State and for their operation and for the distribution and planting of the trout fry was \$22,000.00 or at the rate of \$11,000.00 per year.

It must be borne in mind that not only does the Department have to secure the eggs and hatch them, but later on it must distribute and plant the fry. There were quite a number of necessary repairs to be made to the several trout hatcheries and eyeing stations and the cost of transporting the trout eggs and trout fry consumed not a little of the appropriation. As more than 20,000,000 fry were planted in the waters of the State during that time, it is to be seen at a glance that the total cost for hatching and planting did not quite reach to 60 cents per thousand, without even making any allowance for moneys expended from the appropriation for the improvement and betterment of the hatcheries and eyeing stations, or for the cost of distributing and planting.

As a matter of fact, during the biennium the cost of producing trout fry in the State of Washington did not reach 35 cents per thousand. The

attempts of the State to purchase trout eggs has resulted in our receiving quotations averaging about \$2.00 per thousand and of trout fry about \$3.00 per thousand. These prices were f. o. b. point of purchase and therefore did not include cost of delivery or planting. It is to be seen therefore that the State of Washington produced its own trout fry in 1918 at a cost of one-eighth of what it could have purchased them for had it been possible to purchase them. And, as pointed out above, it has been practically impossible to secure trout eggs in the open market.

A few years ago Eastern Brook Trout eggs were from 60 cents to 80 cents per thousand f. o. b. point of shipment in the East, and within the preceding three or four years it has cost this State on the average of more than \$1.00 a thousand to produce its trout eggs. It is with pardonable pride, therefore, that we point to the fact that during 1917 and 1918 despite the increasing cost of operation, we were able to lower the per thousand cost of trout egg production to one-third what it was only two or three years previous thereto.

In 1917 there were 16,584,875 trout fry planted into the waters of this State and in 1918 there were 19,531,746. In addition in 1917 there were planted 156,400 fry of game fish other than trout and 522,122 in 1918. In response to the requests of several of the County Game Commissions we furnished them 2,706,114 salmon fry during the year 1917 for planting in inland waters and in 1918 furnished 1,381,420. Thus, in 1917 the grand total of fish fry furnished to County Game Commissions in their respective counties was 19,447,389 and in 1918 was 21,435,288.

Some of the counties which have experimented with the planting of salmon fry into their fresh waters are immensely pleased with the results. Particularly are they pleased with the Chinook Salmon. Skamania County more than any other county has planted salmon in their inland waters and the fish resulting therefrom are not only gamy but they are splendid food. Although one of the very smallest if not the smallest county in the State in point of population, Skamania County maintains a comfortable game fund from the sale of a large number of fishing licenses to residents of Oregon who resort to this county for the purpose of catching these salmon which have been planted in their fresh water lakes.

The total number of game birds liberated by the State and several counties in 1917 was 3,456 and in 1918 there were 3,664 liberated.

The tremendous increase in Washington's population in 1918 over what it was in 1917 is shown by the increased number of licenses issued. And the figures further show that this increase occurred almost wholly in Western Washington. The greatest increases were in King County in which the City of Seattle is located and in Snohomish County in which is the city of Everett. King County as usual issued more licenses than any other county in the State, the number in 1918 being 22,021 and 17,867 in 1917—an increase in 1918 over 1917 of 4,154 or in round numbers twenty-five per cent.

In 1917 there was a grand total of 74,133 licenses issued in Western Washington. This number in 1918 was increased to 91,488—an increase of about 23½ per cent. The number of licenses issued in Eastern Washington in 1917 was 53,367, which increased in 1918 to 54,408 or an increase of slightly less than two per cent. The grand total of all licenses issued in

the State of Washington in 1917 was 127,500 and in 1918, 145,896. Of this grand total of 127,500 licenses issued in 1917 only 4,631 were State licenses, while of the grand total of 145,896 issued in 1918 only 6,266 were State licenses. In other words in 1917 the State licenses issued were less than four per cent of the grand total while in 1918 the number of State licenses was slightly over four per cent.

The fact of chief interest disclosed by these figures is that only a comparatively small number of persons are interested in the purchase of State licenses. A reference to the statistical portion of this report will show that almost all of these State licenses are issued in the counties of King, Pierce and Spokane which contain the large cities of Seattle, Tacoma and Spokane. It discloses the fact that a very great majority of the people fish and hunt only in the county in which they reside. It seems to me that in the enactment of all our game laws the Legislature should constantly keep this fact before them.

Since the enactment of the present game and game fish code and previous to the present biennium, King County has held first place in the number of licenses issued, Spokane County second and Snohomish County third. In 1918, however, Snohomish County went to second place, issuing 10,098 licenses. Pierce County moved from fifth place in 1917 to third place in 1918, while Spokane County dropped from second place, which it had always previously held, to fourth place. The five counties in the State issuing the greatest number of licenses in 1917 and 1918 and the number of licenses issued by each is shown below.

1917.		1918.	
King	17,867	King	22,021
Spokane	10,275	Snohomish	10,098
Snohomish	8,987	Pierce	9,739
Yakima	8,298	Spokane	9,277
Pierce	7,420	Yakima	8,443

The prevailing high fur prices are undoubtedly responsible for the fact that the number of trappers' licenses issued in 1918 was 230 or almost double the number issued in 1917 when only 122 were issued.

Below is a brief recapitulation of the licenses issued in 1917 and 1918, divided as to Eastern and Western Washington.

	1917	1918
County Resident—Western Washington.....	70,734	85,040
County Resident—Eastern Washington.....	51,213	52,707
Grand Total	121,947	137,747
Non-Resident County—Western Washington...	417	1,222
Non-Resident County—Eastern Washington...	341	369
Grand Total	758	1,591
Resident State—Western Washington.....	2,862	5,006
Resident State—Eastern Washington.....	1,769	1,260
Grand Total	4,631	6,266
Non-Resident State—Western Washington....	25	30
Non-Resident State—Eastern Washington....	17	32
Grand Total	42	62
Trappers—Western Washington	95	190
Trappers—Eastern Washington	27	40
Grand Total	122	230

The grand total of moneys going into the County and State Game Funds in 1917 was \$149,409.01 and in 1918 it was \$185,947.03—an increase of \$36,538.02. These totals include \$4,515.37 of fines collected in 1917 and \$7,783.10 fines collected in 1918. In 1917 the State Game Fund received \$28,158.06 and in 1918 received \$40,557.01—an increase of \$12,398.95.

The growing sentiment in favor of the enforcement of the game laws is shown by the fact that the per cent of convictions obtained in 1918 was 94.2 per cent as against 84 per cent in 1917, while during the previous years of 1915 and 1916 the per cent of convictions obtained was only 79 per cent. In 1918 in Eastern Washington 99 per cent of the persons arrested for violations of the game laws were convicted. The total number of arrests in 1917 was 479 from which 402 convictions resulted, while in 1918 the total arrests was 667 from which 622 convictions resulted. In Eastern Washington fishing without a license continues to be the greatest violation of the game law. In Western Washington, however, the killing of water fowl before sunrise and after sunset has eclipsed in popularity as a game law violation fishing without a license. In Western Washington in 1918 there were 115 arrests for hunting water fowl before sunrise and after sunset while there were only 49 during the same year for fishing without a license.

Below is given a recapitulation of the more common violations of the game laws in the Eastern and Western sections of the State in 1917 and 1918.

1917.

Western Washington.

Killing waterfowl before sunrise and after sunset.....	53
Fishing without a license.....	45
Fishing out of season.....	35
Hunting out of season.....	34

Fishing without a license.....	49
Unlawful possession of game.....	47
Catching game fish under 6 inches in length.....	38

Eastern Washington.

Fishing without a license.....	51
Hunting out of season.....	22
Catching game fish under 6 inches in length.....	18
Unlawful possession of game.....	16

Encourage Private Propagation.

In my opinion the policy of this State should be to encourage the private propagation of game fish and game birds. It may be possible to a lesser extent to encourage the propagation of game animals. The private propagation of game birds and game fish can not but make for a greater supply. We should do all we can to encourage private trout hatcheries for

which our State law makes provision. Those which are in existence in the State have no trouble whatever to dispose of their output. Indeed, they could all dispose of many more than they produce to the Game Commissions of the various counties of the State. At the present time our County Game Commissions are purchasers to the extent of the opportunity presented of trout fry from private trout hatcheries of other states. No state in the Union possesses greater opportunities for trout production than Washington.

The same statement holds good as regards the propagation of game birds, particularly Chinese Pheasants. At the present time there are quite a number of persons in the State engaged in this on a small scale. They all report orders far in excess of their ability to fill them. Certain portions of Eastern Washington in particular offer exceptional climatic opportunities for the propagation of Chinese Pheasants and Hungarian Partridges. The Legislature now in session has already passed a law permitting the establishment of private game farms and the sale under certain restrictions of their products.

County Game Commissioners Should Expend County Game Funds for Restocking Purposes.

I wish to renew the recommendation heretofore made that the County Game Commissioners should expend the moneys which are raised from the sale of hunting and fishing licenses in either the rearing of game fish, game animals and game birds or in their purchase and liberation. All the moneys that are not needed for the employment of the necessary number of game wardens should be spent for restocking purposes rather than letting it accumulate and remain idle in the treasury. Each passing year sees an increasing toll taken of our game and game fish, and the purpose in raising moneys by our license system is to replenish the supply.

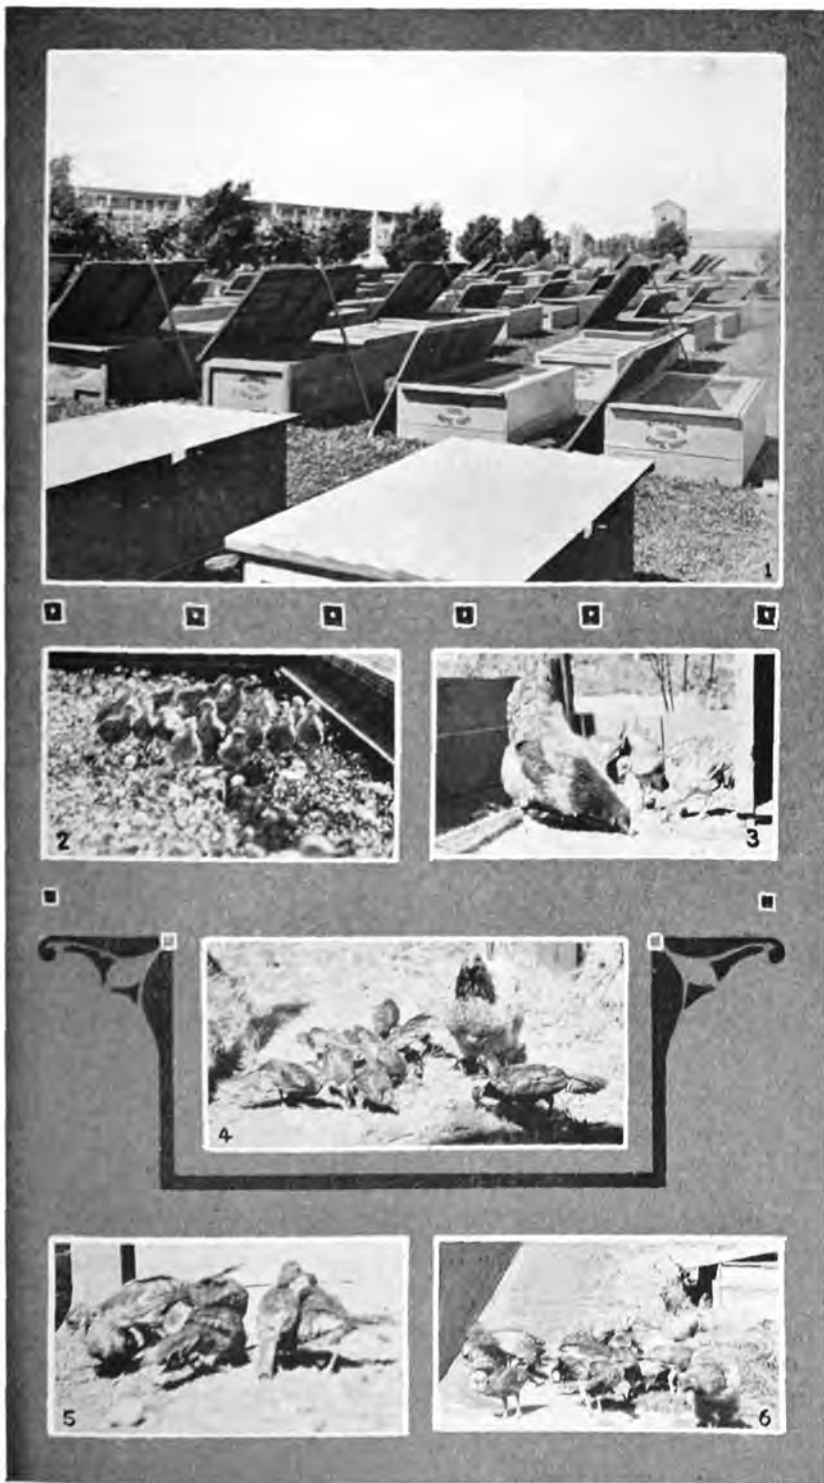

Increased Destruction of Predatory Animals.

The greatly increasing demand for skins and furs has proven a wholesome stimulant for the destruction of a number of the animals which prey upon our wild bird life. The coyote is being given a particularly hard run by trappers and hunters who now find themselves enabled to dispose of his skin at a price ten to twelve times greater than was obtainable a few years since. This Department is in receipt of a constantly increasing number of inquiries from persons who are contemplating the hunting of predatory animals.

Legislation looking to the destruction of the house cats which go astray and possibly for the licensing of cats will undoubtedly be viewed with increasing favor in the immediately succeeding years.

Fine Personnel of County Game Commissions.

I can not too warmly thank the members of the County Game Commissions of the State who are giving of their time without any recompense for the enforcement of our game laws and the perpetuation of our game and game fish supply. In the personnel of the County Game Commissions is to be found the best type of citizenship in the State. The popularity of the County Game Commissions is shown by the fact that efforts to amend or change the law whereby they exist were overwhelmingly defeated at the last two sessions of the Legislature.

HOW THE PHEASANTS AND OTHER GAME BIRDS ARE RAISED AT THE WASHINGTON STATE GAME FARM.

- (1) Field coops for hens with young pheasants. (2) Hungarian partridges, four weeks old. (3) Mongolian partridges, six weeks old, with domestic hen. (4) Silver pheasants, six weeks old, with hen. (5) Golden pheasants, six weeks old. (6) Wild turkeys, six weeks old.

OF THE
UNIVERSITY OF ILLINOIS

Chief Deputy State Game Warden, Mr. J. Stingle of Spokane, in submitting the reports of the Game Wardens of Eastern Washington made the following observations which it will be seen in the main picture the Eastern Washington conditions as identical with those of Western Washington. I quote from the observations submitted by Mr. Stingle:

"The annual reports of the Fish and Game Commissioners of the twenty counties comprising the Eastern Washington District indicate, practically without exception, a substantial unexpended balance in the game funds of their counties. This condition does not evidence receipts accumulating in the county game funds in excess of the needs of the counties for the usual operations in the protection and propagation of fish and game within their boundaries, but does reflect a condition existing during the period of this report under which it has been impossible to purchase game fish or upland birds from private hatcheries or dealers for propagation or restocking purposes. The financial tabulations of this nature show that there has been comparatively small expenditures in nearly all of the counties for either fish or game purchased from private parties, which was contemplated in practically every instance and calculation made for such expenditure in apportioning the funds at the disposal of the county commissions. It proved impossible to obtain game fish fry from private hatcheries.

"Quail, of course, are not obtainable from other states and by reason of drought and other adverse conditions of the past two years Mexico was not able to supply any of these birds to importers, which has previously been a source of supply. Hungarian Partridges were likewise not to be had on account of the strained relations existing with European countries preventing such importation.

"Fortunately, the State Hatcheries and the State Game Farm have been able to supply an increased number of fry and considerable number of Chinese Pheasants for distribution to the eastern counties and this supply has been very helpful in the propagation of game fish and upland birds of the variety mentioned. However, the last two years have been unusually favorable for upland birds as to weather conditions during the nesting seasons and mild winters as well, which have contributed very materially in developing satisfactory game conditions and very encouraging reports as regards both fish and game have been received from county commissioners, game wardens and sportsmen generally of all counties of the district. Quail have done well, indeed, and have more than held their own. Prairie Chickens, as well, have shown very satisfactory increase in most of the counties and it is hoped will soon be found in sufficient numbers in favored localities to supply excellent sport. Hungarian Partridges have multiplied to an extent that was unexpected and have spread over the territory quite generally; these birds being now often found in counties where they had not been liberated. It is not in any way exaggerating to state that with a continuation of the increase shown during the past two years, Hungarians will be one of our best game birds, if not actually the best, found within this district. In some of the counties where temporary closed seasons on particular birds have been enforced there is evidence of sufficient increase to warrant the removal of this protection within the near future, which illustrates the dependable results obtainable through timely protection as now adopted as a definite policy throughout the district. All features being considered, it is beyond question that both fish and game conditions in the Eastern District of the State have shown much improvement and there is an encouraging outlook for the future in this respect."
