

DEPARTMENT OF

PISSE AND GAPLE

The Honorable Tim Babcock Governor of Montana Helena, Montana

Dear Governor Babcock:

The Montana Fish and Game Commission respectfully submite its biennial report for the period of May 1, 1966 through April 30, 1968.

This report briefly aummarizes major activities of the department and presents an accounting of department income and expenditures for this period.

Respectfully aubmitted,

Lyle H. Tauck, Chairman W. E. Staves, Vice Chairman E. G. Leipheimer, Jr.. Member John T. Hanson, Sr.. Member J. J. Klabunde, Member

### PRESERVING A LIVABLE ENVIRONMENT

Frank H. Dunkle

Fifteen or 20 years ago most of us couldn't really visualize how rapidly the world was shrinking, how dramatically the environment was changing, or how the philosophies and standards of man were re-shaping. Many Montanans felt, and probably hoped, that our state was so isolated, so big and backward that it would always be a land of small towns, open range and clear streams.

Not so! The small towns have been abandoned for cities which are becoming ever larger. The open range has been fenced. The dwindling streams which yet remain clear are eyed covetously by water-hungry states hundreds of miles away. Missile silos remind us that we are part of a global society, like it or not. The appearance of "hippies" in our society speaks of new philosophies and new standards.

The course that mankind is taking, many say, is one of blundering rather than of purposeful direction. The price paid for lack of direction is the deterioration of Montana's big sky country. We have spread persistent poisons and radio-active materials widely. The components of our atmosphere are being so radically changed that some scientists fear the results will eventually spell doom for our state, our world. In this age of specialization, it is difficult for the specialist to relate his actions to total water, land and air.

We can progress. In economic and industrial evolution there is growing a demand for direction. Gradually mankind is coming to realize that survival will ultimately depend upon fitting himself into his environment rather than warping the environment to his whims. Such things as air and water pollution and the maintenance of natural features are receiving more and more concern.

Over the years there have been some gifted persons with vision to foresee the loss and destruction of our natural resources. These have been the great leaders in conservation movements. Gifford Pinchot, Olaus Murie, and Rachel Carson are but a few of the memorable ones. Over the years also, there have been agencies which by the very nature of their responsibilities have fought to salvage from progress what we now term a "livable environment". The fight to maintain a livable environment has been an upfill and often lonely battle. Yet it is certain that the inhabitant of the future will breathe clean air. He will have treasured fragments of wilderness, cool streams in which to fish, and forests in which he may hunt. He will have the leaders and agencies of conservation in the past to thank for forestalling complete deterioration of his world.

We of the Montana Fish and Game Department are proud and honored in being able to play an important role in the preservation of a "livable environment".

Frank H. Dunkle Director Montana Fish & Game Department

### DEPARTMENT ADMINISTRATION

For administrative purposes, the state is divided into seven supervisory districts with headquarters in Kalispell (District 1); Missoula (District 2); Bozeman (District 3); Great Falls (District 4); Billings (District 5); Glasgow (District 6); and Miles City (District 7).

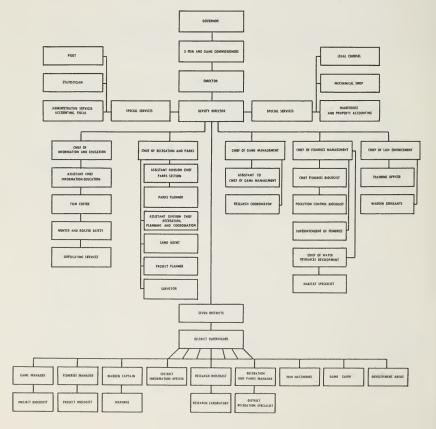

Each district supervisor has day to day supervision of all persons assigned to his district and is responsible to the department director or, in his absence, the deputy director.

Division chiefs compose the director's staff. The staff plans, coordinates, and budgets for various activities of the department under direct

supervision of the director. District supervisory personnel see that programs planned by the staff and approved by the director are carried out.

The main source of income to the Fish and Game Department is from the sale of hunting and fishing licenses. A second major source of income is from federal excise taxes on sports firearms, ammunition, and fishing equipment. These funds, known as Pittman-Robertson and Dingell-Johnson funds, are allotted to various states primarily on basis of the size of the state and license sales in the state.

The only appropriation which comes from the state general fund is for state parks.

### FISHERIES MANAGEMENT

Many sensitive instruments are used in the science of fisheries management. The tape shown in actual size above is from an echo sounder. The echo sounder shows water depths, lake bottom configuration, and general configuration of other objects in the water. The heavy line at top represents Flathead Lake surface. The irregular heavy line at the bottom represents the lake bottom. Small dots in between are fish, and the dot cluster immediately above inset of Flathead work boat shows a school of fish.

The fishery management program was characterized during the biennium by efforts to preserve, protect and restore fish habitat, resulting in improving the quality and quantity of Montana's overall fishery. Application of research, intensified co-ordination with construction agencies under the Stream Preservation Act and initiating closer co-ordination with agencies and individuals not covered by the Act were among techniques used to improve Montana's position as the number one trout fishing state in the nation.

### Bluewater & Rock Creek Study

Stream fishing in Montana is predominantly the result of production of wild trout, which require quality water for continued production. Studies of Bluewater Creek near Fromberg and Rock Creek near Red Lodge demonstrate the detrimental effects of silt and sedimentation on trout survival. It was found that a great deal of these streams' silt burden was caused from man-made reasons, and when the erosion-siltation sources were rectified to alleviate siltation there was an accompanying and proportional increase in wild trout. The studies are continuing to analyze sources and control of soil erosion and stream bank breakdown. The information obtained will greatly benefit fish habitat and the streams carrying capacity for fish, and be of value to property owners in terms of channel stability and soil retention.

### River Electrofishing Project

Big rivers, like the Madison, Missouri, Jefferson, Yellowstone and Big Hole are very popular with Montana anglers and are a major tourist attraction in Montana. Because of their size, it has been previously impossible to sample and research them as smaller streams can be handled Research technique breakthroughs now make possible the gathering of adequate and accurate information to manage these large rivers in a manner to enhance and sustain this already tremendous fishery resource. During the past two years, surveys have been made on the East Gallatin, Madison, Beaverhead, Ruby and Shields Rivers, and O'Dell. Rocky and Prickly Pear Creeks, and started on the West Gallatin and Yellowstone Rivers. Information to date reveals large rivers have a tremendous annual turnover of game fish, just as small creeks do, little of which is due to fishing pressure. The Madison, heavily fished by Montana standards, has been discovered to lose only 12% of its annual fish mortality to anglers. From this type of information it can be readily calculated just how much fishing a large river can provide and what sort of regulations are needed, if any, to insure the potential is not exceeded.

### Flathead Lake Study

Flathead Lake, the largest fresh water lake west of the Mississippi, is among the very top fishing attractions in Montana. Fishery managers have been getting a good look into this natural body of water by means of a special boat equipped with the gear necessary to probe all portions of the lake. The study includes all life in the water, most importantly the fish, and from the microscopic free-floating plankton through the worms and insects that live in the bottom mud. In Flathead Lake, many fish species lead complex lives. Some spend their entire lives in the lake. Others are born and spend their early lives in the more than 700 miles of streams of the upper tributaries and come down to the lake as adults, later returning to the tributaries to spawn. Determination of the fish distribution in the lake throughout the seasons is important so that all the factors necessary for perpetuation of the game species can be taken into account by fisheries managers. A very modern sounder that can detect fish as well as determine bottom contours has produced information of immediate use by anglers as well as long term scientific data. Accurate forecasts can be given of the most likely areas anglers will find cutthroat, kokanee, Dolly Varden or lake trout at various seasons. It has been discovered that Flathead has a good population of lake whitefish which anglers have seldom sought before. The information has been determined and made available to the fishing public that the kokanee is almost uniformly spread over the entire lake at depths of 50-70 feet during the summer months.

The answers which the Flathead Lake investigations will provide will be the keys to continued enhancement and utilization of the game species which must live in both the lake and the tributaries, especially in the light of dam proposals which if built would create additional barriers to spawning runs. The study may also reveal that additional game fish species might be introduced into Flathead which would be compatible with the existing life there and broaden the sport fishing base of the lake, such as the coho.

### Pollution Control

The State Department of Health administers the Montana Water Pollution Control Act. The Fish and Game Department's pollution control biologist is attached by cooperative agreement to the Department of Health to work with water pollution where fish and game resources are involved.

Considerable progress has been made in the control of water pollution by industries and municipalities. Sediment pollution from agricultural, construction and timber harvest remain a very scrious problem.

A relatively new kind of pollution, thermal pollution, is growing to frightening proportions in some parts of the United States. Thermal pollution results when water is taken from a river or lake, used to cool generating plants or other industrial complexes and is then discharged much heated back to the parent water.

The Fish and Game Department's pollution control work had two major activities during the biennium. The first was working with the Water Pollution Control Council in the reclassification of Montana waters and establishment of water quality criteria to insure that the adopted criteria and standards would be adequate to preserve fish and wildlife values. Secondly, the pollution of the Clark Fork River required a major effort in monitoring water quality and associated investigations.

### Fort Peck Commercial Fisheries Investigations

A commercial fishery investigation of Fort Peck Reservoir was started during the biennium. Passage of the Commercial Fisheries and Development Act of 1964 (Public Law 88-309) allowed partial funding of this work by the U.S. Bureau of Commercial Fisheries. A 35-foot work boat, suitable for all weather operation on Montana's largest reservoir, was constructed and two permanent employees have been assigned to the investigation.

Goldeye, one of the most valuable commercial species in the reservoir, but quite undesirable to Montana anglers, had been passed up by commercial fishermen in the past because they were not able to capture these fish without also taking large numbers of game species. Thus, the first objective of the study was to find a way to take goldeye selectively. A technique was developed, using floating gill nets, fished away from shallow areas, that resulted in a catch over aix-months period that was 99.95 percent goldeye. With this technique, plus promotion by local business groups, a commercial fishery for goldeye was begun in 1967. About 50,000 pounds of Fort Peck goldeye were marketed in Winnipeg (North

Spray of fish is headed for a lake high in the mountains. Most of the areas that are difficult to reach by fisheries trucks are now stocked with fish from aircraft.

America's major goldeye market) in 1967 and a contract for 100,000 pounds is pending for 1968.

Other work of this study includes sampling for concentrations of commercially valuable species throughout the entire reservoir and marking northern pike to learn more about the migration patterns and abundance of this popular game fish. Although the northern pike cannot be taken commercially, a knowledge of his areas of concentration is important to commercial operators so they can avoid him.

### Summary

In terms of variety of game fish species, number of quality streams, rivers and lakes, and fisherman accessibility Montana has assumed the position of number one trout fishing state in the nation. This is particularly significant where wild trout are concerned. Montana has partly come into this position due to research and application preserving fisheries values, and legal means necessary to maintain the resources. Montana has also reached this position due to former excellent fish producing states falling behind in the crush of competition for land and water uses which result in massive pollution and fish habitat destruction. The pressure grows in direct proportion to population increases and the complexity of resolving more and more conflicts of interests over Montana water and watersheds. Montana Fish and Game Department programs aim at perpetuating and enhancing habitat values beneficial to fish and the wise utilization of this important resource in the face of whatever the future may have to offer.

### Fish Hatcheries

Montana fish hatcheries have continued to emphasize quality in the overall fish cultural program; at the same time maintaining sufficient production to meet all of the plants requested by fish managers throughout the state. Improvements in fish diets and fish treatments have resulted in fast growing trout with relatively low mortalities. Fish transportation has improved also. New fiberglass distribution tanks at several of the hatcheries make it possible to transport fish practically across the state with negligible losses.

At the department's oldest fish hatchery in Anaconda, new concrete tanks were constructed in the hatchery building. These tanks replace troughs which had been in use since 1908. The new tanks have greatly increased the efficiency of the Anaconda hatchery in producing fish of the proper size at the proper time for planting.

At the Bluewater Hatchery near Bridger, trout have been hatched in boxes in the large 10-by 100-foot race-ways—an inconvenient operation. A new hatchery building is being constructed at Bluewater where the eggs can be hatched under much better controlled conditions.

A great deal of assistance in disease investigations and treatments has been received from the Federal Hatchery Development Center located at Bozeman. Personnel at the center, trained in fish pathology, have been most cooperative in checking on problems at any of the state hatcheries. In addition, national fish hatcheries at Ennis, Creston, and Miles City play an important part in the stocking of fish in state waters.

Water development projects present problems to resource management agencies. This mud flat is of no value to fish, wildlife or recreation in its present condition.

### Water Resource Development

Water developments in Montana have been affecting our fish and wildlife resource in two basic ways. First, they consume land, frequently critical range areas, formerly used by a variety of wildlife. Secondly, they create an artificial aquatic environment that is not necessarily suited to Montana game fish species. Greatly increased activity in water resource planning and development in recent years necessitated creation of a water resource development section within the fisheries division.

Over the past two years this section has been participating in the development of two comprehensive river basin plans, one for the Missouri, one for the Columbia, and has worked with constructing agencies and the Fish and Wildlife Service on specific water development projects.

The Fish and Game Department has taken the position that since these development projects are federally financed, the financial responsibility for determining the effect on existing resources and ways to replace fish and wildlife habitat sacrificed lies with each individual project and should not be the responsibility of Montana's sportsmen. In order to accomplish the needed work, the Water Resource Development Section has prepared detailed study outlines and budgets for several projects and offered to perform the necessary work on a contract basis. These proposals are currently under study by various construction agencies. Should this concept and these proposals be accepted, it will be a first step toward constructing

multipurpose projects in fact, rather than just in name.

### Habitat Preservation and Improvement

During the biennium, the department received 93 legal notices of construction of projects affecting fishing waters. These notices to the Fish and Game Department are required by the Stream Preservation Act from most state, city and county agencies. Forty-nine of these projects were not harmful to fish habitat as planned. On the remaining 44 projects we made recommendations for certain changes to reduce or eliminate the fish habitat destruction they would have caused if constructed as originally planned. On some projects the department asked that road alignments be changed to avoid streams entirely, on others the department asked for additional bridges to preserve natural, meandering channels. On other projects where alignment changes or bridges were not feasible, the department recommended new meanders be built to replace those cut off in order that the total stream length would be the same after the profect as before. Where channel changes have been unavoidable, the department has asked that new channels be excavated in the dry to minimize silt pollution. Preservation of streamside vegetation during construction has been asked and where this is not possible, that bare banks be revegetated as soon as possible. Apparently the requests for these special considerations have been reasonable for not one was denied. Thus, it has not been necessary to submit any project to the arbitration provided for in the act.

Through cooperative agreements, several federal agencies follow the intent of Montana's Stream Preservation Act. Some private individuals also seek advice on stream construction projects, although like the federal agencies, they do not come under the act. More inclusive legislation would be beneficial to Montana's stream fishery resource; however, the present act has allowed the department and the construction agencies involved to greatly reduce the stream habitat destruction that was occurring before 1963.

The goal of fisheries management is quality recreation.

Playing out the net for a commercial carp fishing operation on Lake Halene near Helena, Montena. Long distances and vagaries of markets make inland fishing difficult. Few western states have more than two or three commercial fishermen on inland waters.

### GAME MANAGEMENT

The goal of game management is quality recreation.

Photo by Garry Atwell.

Big Game

The number of big game animals taken by hunters in Montana increased in 1966 over the previous year. The new more expensive license structure, which discouraged the taking of second deer, combined with more conservative hunting regulations to reduce the hunter take in 1967, although hunter success was a high 77%. The near overabundance of deer in many hunting areas warrant some adjustment in licensing structure so more hunter effort toward taking second deer in those areas could be accomplished.

Spectacular antelope fawn production over the biennium is rapidly countering the effects of the severe winter of 64-65. Reduced quotas have been held to for northeastern and southeastern Montana allowing the base herds to increase back to maximum allowable sizes, at which time the excellent production will be reflected in considerably higher hunter quotas.

Montana continues to maintain high bighorn sheep hunting opportunity. The combination of high hunter success and trapping is keeping the Sun River sheep herd productive but barely within what its winter range will stand. The Rock Creek bighorn population in Granite County is a current problem, with lack of winter range, parasites and disease causing high mortalities.

The elk harvest rose from 12,450 in 1966 to 14,500 in 1967 in spite of relatively mild fall weather. More intensive management of specific areas is providing increased hunting opportunity. A five-year study of the Sun River elk indicates that the Sun River Game Preserve is a hindrance to raising the productivity of that herd. The Gallatin portion of the Northern Yellowstone elk, historically a trouble spot, requires close continuous attention as weather plays such a crucial and unpredictable part in the proper harvest. The special late seasons have accomplished much toward adequate management of these elk and making more elk hunting available.

### Upland Game Birds

The mountain grouse population and harvest showed good stability during the biennium. The production and harvest of pheasants, sharptail, sage hens and Hungarian partridge was quite high in 1966. The exceptionally long, snowy, wet spring of 1967 made conditions unfavorable for game bird production, which was reflected in the 1967 harvest of those species. The fairly mild spring of

1968 was conducive to increased production of upland birds and probable increased harvest.

### Waterfowl

The waterfowl harvest was maintained at a high level. In excess of 200,000 ducks and 11,000 Canada geese were harvested in the state. The Pacific Flyway contributed most of the harvest. Solid research provided the key to establishing an annual post-season hunt for drake mallards in the Central Flyway portion of Montana, which significantly increases the hunting opportunity for Eastern Montana.

### Research in Montana Game Management

Game research is being conducted in three major fields:

Big game research has involved study of food and range requirements of deer, elk, antelope, moose and bighorn sheep. These studies have included, in pertinent areas, forage relationships with livestock. Intensive studies of the seasonal movements, harvest and productivity of segments of the Sun River elk herd and investigations of the productivity of Northern Yellowstone elk have resulted in important findings assisting beneficial management of these nationally-known herds. These findings have useful application as well to even more comprehensive management of Montana's big game and its habitat state-wide.

Small game research examines the habits, habitat requirements, life history, harvest effects, land use and other factors concerning blue and sharptail grouse, enabling the perpetuation and best utilization of these popular native grouse resources.

Pesticide-wildlife research details the effects of insecticides and herbicides on game birds and animals. Forest grouse-DDT studies contributed to

discontinuance of use of persistent-pesticides on public forests. Effects of sagebrush removal on antelope and sage grouse habitat and related plant, animal and insect life are being evaluated in central Montana in a co-operative long-term study by the Montana Fish and Game and the Bureau of Land Management. Already providing knowledge with immediate application, the final results of this study will be very important in future public land management decisions concerning the various uses of sagebrush-grasslands for optimum public benefits. Game research projects are carried out by a small efficient research staff. University System personnel and facilities are utilized for certain research phases.

### Game Management Problems

The process of adjusting big game animal numbers to their winter forage supply is continuous and there are stil! deer and elk problem areas in Montana. The rapid changes of habitat for other primary uses is a constant threat to big game and small game species. The influence of the department on landowners and land managers is necessarily one of persuasion backed by solid, reliable research on the effects of different land use management and techniques on wildlife. Competition for land and water use is becoming so severe that research requirements which must be met grow directly in proportion.

Hunter access is an item of growing importance lest lack of it become a major problem. Although a considerable amount of Montana is public land, a majority or substantial amount of the hunting takes place on private land. Since fish and game wildlife management areas account for only 6/1000 of 1 percent of Montana's land, they will never be able to provide sufficient open hunting territory. Intensification of present programs to maintain lands open to public hunting is necessary.

The total effects of sagebrush removal are being cooperatively studied by the Montana Fish and Game Department and the Bureau of Land Management. The helicopter is spraying sagebrush.

### Summary

Despite the diversity of climate, geology, population and weather to be expected in a land area as large as Montana, the overall game bird and animal resource stands in condition to support heavy utilization for outdoor recreation hunting

opportunity on a sustained basis. As population pressures mount steadily on all natural resources, maintaining the wise use of renewable resources such as game must become more complex and at times controversial as even more widespread conflicts of interests must be resolved.

Unit workers recording measurements of the grizzly bear end preparing to instrument it with a radio transmitter.

### Cooperative Wildlife Research Unit

The Montana Cooperative Wildlife Research Unit was established at the University of Montana on February 8, 1950. It is operated through a coordinating committee with representatives for the State Fish and Game Department, University of Montana, U.S. Fish and Wildlife Service, and Wildlife Management Institute. The unit's objectives are to provide professional training in wildlife research and related fields, to demonstrate the findings of this research through extension woek and practical game management, and to disseminate research findings by means of publications and extension activity.

### Research Projects

The following research projects were in progress during the biennium:

- 1. Aging of fishers and analysis of reproductive systems.
- 2. An ecological study of the grizzly bear.

- An intensive study of elk behavior on the Mirror Plateau summer range, Yellowstone National Park.
- A preliminary study of the breeding biology of the spruce grouse (Canachites canadensis franklinii) in northwestern Montana.
- 5. Bighorn sheep population study, Wildhorse Island.
- Competition between big game and cattle in the Gird Creek Area of Montana.
- 7. Development of the pronghorn antelope fawn.
- 8. Ecology of the golden eagle.
- 9. Elk migration study, Yellowstone National Park.
- 10. Factors limiting a Montana population of Rocky Mountain bighorn sheep.
- 11. Magpie population dynamics.
- 12. Nesting raptor pesticide relations.
- 13. Population study of Canada geese in the Flathead Valley.
- 14. Quantitative aspects of raptor predation.
- Radiotracking and telemetering system for large western mammals.
- 16. Rattlesnake Creek mule deer winter range study.
- 17. River classification and evaluation.
- 18. Seasonal condition of mule deer.
- 19. Study of alpine ecology in the northern Rocky Mountains.
- Study of phenomena related to reproduction in the pronghorn.
   Systematics of blue grouse in northwestern Montana.
- Completed projects have been reported on in journals or theses, and in addition, segments of some continuing projects have been published.

Rabies control program Wildlife rabies in Montana has most commonly been confirmed in skunks. The most effective action to minimize rabies, recommended by the Governor's Advisory Committee on Rabies Control, has been found to be intensive effort directed at limited areas and/or breeding populations in up to a three mile zone around detected rabies cases to afford maximum isolation. There is no evidence to support general skunk suppression programs in non-infected areas.

The Legislature appropriated \$25,000 for the rabies control and suppression program for the 1967-68 biennium to the Livestock Sanitary Board and the program was directed to the Montana Fish and Game Department by Executive Order. The Montana Fish and Game Commission has designated \$10,000 of the \$40,000 annually appropriated for predator control to be utilized for rabies work with the approval of the Director or his agent.

There are no "dull moments" for the enforcement officer. Warden Kent of Helena prepares to haul in supplies for fencing elk out of haystacks. An inverted automobile hood was discovered to make a good sled.

### LAW ENFORCEMENT

The need of enforcement for protection of Montana's fish, wildlife and recreational resources is continually growing. More people with an increasing amount of leisure time seek relaxation and recreation in Montana's great outdoors. Guidance of the public to a wise use of this resource is a basic responsibility of the law enforcement division. The law enforcement staff has been expanded to keep pace with the increased use.

A rather recent innovation to the enforcement program is the use of warden sergeants for special investigation programs. During peak periods such as season openings and special seasons, when the pressure is unusually heavy at given locations, warden sergeants are shifted to these areas to help meet the situation.

Montan maintains about 55 wardens to patrol over 147,000 square miles. Many of these miles are rugged back-country and wilderness areas. It is practically impossible for a regular warden to maintain a thorough coverage of his area, keep current in his other duties and still be able to investigate special enforcement problems that crop up from time to time. Also, the local warden often is limited in his operation because of his familiarity to poachers, lack of time for continuous investigation and surveillance and other duties that keep him busy. Many of these special problems require a man in plain clothes and an unfamiliar

face to bring about a prosecution. This is one of the duties where the special investigation program has proven very successful.

The higher court's recent decisions demand a new and professional approach to law enforcement. The Fish and Game training program has been expanded and intensified to meet this demand. Personnel qualifications are being upgraded. New and improved equipment and techniques are being used.

There were 4,622 arrests for violations of Montana Fish and Game laws during the past biennium. This is a significant increase over the preceding biennium of 39%. The increase reflects increased public use, expanded enforcement duties in water safety and better law enforcement. It also reflects a more efficient and better trained enforcement staff.

Landowner-sportsmen relationships continue to be of concern. More private land is closed to public recreational use each year. The enforcement staff has made a concerted effort to assist both landowners and sportsmen in fostering a better understanding and promoting reasonable public recreational use of private land. The enforcement of laws for better control of private land abuse has been helpful. Landowners have been urged to open their private property to reasonable public use.

Wildlife and wildlife habitat protection are prime objectives of a sound enforcement program.

All in a day's work. Warden Kent removes a "road kill."

As cities become larger and more hostile, the desire of people to get away from it all for a while becomes more impelling. There must be places provided for these recreationists. Quality recreation areas such as this one on Canyon Ferry Reservoir are literally becoming worth their weight in gold.

### RECREATION AND PARKS

The increased national interest in outdoor recreation has been reflected in an accelerated recreation and parks program in Montana. New areas have been added and planning and construction projects are going ahead in the existing areas. Long range plans have been developed for many of the areas in preparation for the construction phase of the program as funds permit. A comprehensive Statewide Outdoor Recreation Plan, completed three years ago and more recently updated, has provided important overall guide lines for this work.

In cooperation with the Bureau of Outdoor Recreation and with matching funds provided by the Land and Water Conservation Act, it has been possible to accelerate the entire program from the local to the state level. Matching funds have been available to acquire and develop outdoor recreation areas by local and state agencies. Over four and one-half million dollars have been invested in this program during its four year life and the results are evident in areas and structures throughout the state ranging from city swimming pools and playfields to state parks.

State Parks, Monuments and Recreation Areas

The total number of areas in these categories has increased from 30 to 39 during the biennium. These areas vary from some added to the system for protection such as the famed Citadel Rock on the Missouri River Recreational Waterway to an important archaeological site such as the Madison Buffalo Jump.

Development of primitive boat access camping areas along the Missouri River Recreational Waterway was initiated by the acquisition of five small key tracts. It is expected that minimum development of these areas can be accomplished early in the next biennium.

### Fishing Access Acquisition and Development

This is a continuing program. Several new areas were organized and development of the new and existing areas was carried on as fast as funds would permit. These access sites are designed to get the fisherman to prime fishing waters and in addition, the attempt is being made to provide camping and picnicking facilities wherever possible.

This is a particularly popular program with the sportsmen and landowners as it provides legal access for the recreationist and has gone a long way toward solving serious trespass problems.

### Land Acquisition

Efforts in this program during the biennium have emphasized the purchase of lands desirable for water oriented recreation. Prices for this type of property are accelerating at a rapid rate. It is felt that important areas for this purpose should be acquired as rapidly as possible even though development may have to wait for some time.

Careful planning is required to assure the greatest benefit to the recreationist from available funds. Close cooperation with federal and other state agencies makes it possible to gain administrative control over certain areas without necessitating acquisition by fee title. Donations and gifts of land by individuals have also been helpful.

Fee titles were acquired to 840 acres of land at

nine sites by purchase and several sites were acquired by exchange of land deemed surplus. Payments in lieu of taxes are made on most of the land owned and like other landowners, this cost is continuing upward.

The Legislature will be requested to approve additional funds for land acquisition and in turn to clarify the procedures for disposition of surplus portions of state parks.

### Preservation of Historic Sites

National legislation (a National Act for the Preservation of Historic Sites-Public Law 89-665) followed by appropriate state level action gave the responsibility for administration of this program to the Recreation and Parks Division of the department. This is a Grant-In-Aid program and will require an appropriation of state funds for its implementation. This program can be extremely important in the preservation of Montana's historic past.

All avenues of communications are utilized in the Fish and Game Department's Information-Education program. Film center technicians shoot final footage while preparing a fish and game film.

### INFORMATION-EDUCATION DIVISION

Montanans have characteristically been an outdoor people, and outdoors to a large percentage of them is synonomous with hunting and fishing. Probably no other resource or activity in Montana is subject to as much controversy as is game, its management and regulation. The controversy is not limited to hunters, but embraces landowners who may or may not hunt, other state and federal resource agencies, nature lovers, anti-gun elements, pro-gun elements, guides and outfitters, sports dealers and nearly every other segment of our citizenry. The management of game and regulation of its hunting affects so many people in so many ways that controversy, often heated, is chronic and inevitable. Sound information, however, can help to keep these controversies constructive rather than destructive.

Each week there are hundreds of inquiries for

specific information made to the Fish and Game Department. Many of these inquiries can be answered with prepared literature, but special letters are prepared for those which cannot. In addition, a monthly publication, "Montana Outdoors" is distributed to sports groups, legislators, schools and to other Montanans who request it. The magazine "Montana Wildlife" is published on an irregular schedule as time permits its preparation.

On most Fridays almost 800 news releases are mailed to newspapers, TV and radio stations, sportswriters, legislators, county attorneys, and other important sources. The Friday release date has been chosen as it comes the nearest to satisfying both daily and weekly papers. Feature stories are prepared also, assistance is given to national sportswriters, and to editors working on

special features. District information officers are also providing these services on a district basis.

A major effort has been made to get television and radio time as well as viewing audiences for film. Most district 1 & E officers have regular radio or television programs, or programs for both. Film center space was enlarged over the biennium.

Major films made include: Yellowstone Recreational Waterway, Float the Yellowstone, Missouri River Recreations Waterway, The Sun River, Fish Hatcheries Today, Montana Big Game\*, Antelope Hunt\*(hunter safety), Hunting the Whitetail\*, Montana Elk\*, Prairie Grouse\*, and Outdoor Recreation\* (\*titles in Montana Outdoors TV series)

Films that will be made by Jan. 1, 1969 include: Sagebrush, Montana Game, Montana Fish, Montana Recreation, Inside the Sun, Flathead Recreational Waterway. The loan library averages 50 titles on hand and are used by civic, sporting, church, educational and other groups, and are shown to an audience of 30,000 each year, averaging 24 people per showing

Spots for radio and television are produced on a continuous seasonal basis in the areas of hunter safety, special permit deadline reminders. National

Wildlife Week, Conservation Week, landowner-recreationist relations and other things to keep updating information to the public.

Approximately 150 five-to-ten minute radio programs on a multiplicity of subjects have been made and distributed to a minimum of 24 Montana radio stations.

The hunter safety program, administered by the department and taught by volunteer instructors, has brought instruction in safe handling of firearms to over 76,000 students. Each year an award for the program has been won, and during 1967 a first place award was presented to the Montana Fish & Game Department for outstanding contribution in the field of hunter safety. The award was given by the National Rifle Association and competition was among most states and Canadian provinces.

During the biennium also there was a rigorous program for schools and for organized youth groups.

The "3-C program", a landowner-recreationist oriented program, has been instigated in all areas of the state. The program's theme is consideration, cooperation, and common sense. Its aim is to promote better landowner-recreationist relations. Eight dollars of the twenty-dollar Sportsmen's License is earmarked for this program.

The f and E man's job is not one entirely of communications. Here District 2 Information Officer, Keith Seaburg, pumps stomach contents from a trout while helping investigate suspected stream pollution.

FINANCIAL REPORT
