URVARA API SECURITY CASE STUDY

The Problem: A finance company with 150 employess, suffered an API breach that leaked 50,000 customer records. They had:

- 73 APIs (thought they had 45)
- 28 APIs with no authentication
- No visibility into API threats
- Facing regulatory fines

Our Solution:

- API Gateway with centralized security
- Real-time threat monitoring
- Automated security testing in development
- OAuth 2.0 authentication standardized (A secure authorization standard that lets you grant access to applications without sharing your password.)

Results - after 6 months:

- Zero API breaches
- Passed PCI-DSS audit (Security standard for payment processors)
- Avoided fines
- Faster API deployment
- Closed 3 major enterprise deals requiring SOC 2 (System and organization controls)

Notes: Most companies don't know how many APIs they have. URVARA's API security solutions prevent breaches and accelerates business growth by meeting enterprise compliance requirements.
