# **Predicting Car Accident Severity**

to improve public safety outreach in the United States

Team 4: Thomas Berdahl and Alyssa Duran DAAN 888 Spring 2024

## **Project Research Question**

**Background:** In 2021, there were 39,508 fatal motor vehicle crashes accounting for 42,939 deaths in the United States(Fatality Facts, n.d.). This is equal to 12.9 deaths per 100,000 people, and 1.37 deaths per 100 million miles traveled.

**Scope:** We utilized US car accident data to predict accident severity, considering factors like weather, time, and road conditions. Our model aimed to help government agencies issue real-time alerts about hazardous conditions, enhancing driver awareness and safety.

## **Dataset Description and Source**

**Description:** This dataset contains about 7.7 million accident records from February 2016 to March of 2023 in 49 states of the USA. Attributes include time, location, street conditions, weather, light conditions, and accident severity. With this dataset we will be able to evaluate the components and build a supervised predictive model.

## **Data Exploration and Issues (Continued)**

#### Severity (Response Variable) Distribution

| Value | Distribution   | Meaning                          | 1e6<br>6 - | Severity Histogram |
|-------|----------------|----------------------------------|------------|--------------------|
| 1     | 0.44% (67K)    | Lowest Severity; No Delay        | 5 -        |                    |
| 2     | 79.97% (6.15M) | Minimal Severity & Delays        | 3 -        |                    |
| 3     | 16.86% (1.29M) | Severe; Significant Delays       | 2 -        |                    |
| 4     | 2.66% (205K)   | Highest Severity; Extreme Delays | 0 1.0 1    | .5 2.0 2.5 3.0 3.5 |

- Data Imbalance of response variable
  - Sampling methods will need to be used

## **Data Exploration and Issues (Continued)**

- Columns with Low Variance:
  - Distance(mi)
  - Turning\_Loop 100% False
- Columns with No Relevance:
  - Wind\_Chill(F) Highly correlated with temperature (r=0.99)
  - 16 Other Columns
    - ID, State, County, Airport\_Code, etc.

## Data Cleaning

- Variable Transformation
  - Boolean variables from 0 to 1 (16 Columns) Split date & time into separate columns Date: 2016-02-08 07:44:26 Ο
  - Ο

| Severity | Year | Month | Hour_of_Day | Day_of_Week |  |
|----------|------|-------|-------------|-------------|--|
| 1        | 2016 | 2     | 7           | 0           |  |

- String to number transformations using dictionary Ο
  - Values in 'Weather Conditions' were aggregated with a dict, split on comma, and binarized. **Example:**

| SEVERITY | WIND | RAIN | SNOW/ICE | CLEAR | FOG | CLOUDY | THUNDER | TORNADO | DUSTSTORM<br>/DEBRIS |
|----------|------|------|----------|-------|-----|--------|---------|---------|----------------------|
| 4        | 1    | 0    | 1        | 0     | 0   | 1      | 0       | 0       | 0                    |

## Data Cleaning

- Variable Transformation
  - Boolean variables from 0 to 1 (16 Columns) Split date & time into separate columns Date: 2016-02-08 07:44:26 Ο
  - Ο

| Severity | Year | Month | Hour_of_Day | Day_of_Week |  |
|----------|------|-------|-------------|-------------|--|
| 1        | 2016 | 2     | 7           | 0           |  |

- String to number transformations using dictionary Ο
  - Values in 'Weather Conditions' were aggregated with a dict, split on comma, and binarized. **Example:**

| SEVERITY | WIND | RAIN | SNOW/ICE | CLEAR | FOG | CLOUDY | THUNDER | TORNADO | DUSTSTORM<br>/DEBRIS |
|----------|------|------|----------|-------|-----|--------|---------|---------|----------------------|
| 4        | 1    | 0    | 1        | 0     | 0   | 1      | 0       | 0       | 0                    |

# Data Cleaning (Continued)

- Remove Null Values
- Outlier Detection & Removal
  - IQR Formula
  - Performed on 'Temperature(F)', Pressure(in)', 'Wind\_Speed(mph)'.
- Cleaning Summary
  - Removed 2.93M values; Left with 4790161

## **Model Preparation**

- Multicollinearity
- Data Partitioning
- Data Imbalance
  - Random Undersampling
  - Oversampling using SMOTE
  - Random Forest Parameter class\_weight ='balanced'

Training data set distribution:

| 'Severity' Value | Total Values | Distribution PCT |
|------------------|--------------|------------------|
| 1 (Least Severe) | 43,552       | 1.1%             |
| 2                | 3,237,561    | 84.5%            |
| 3                | 462,597      | 12.1%            |
| 4 (Most Severe)  | 88,418       | 2.3%             |

#### **Model Parameters**

- Model Type: Random Forest
- Training/Testing/Validation Split: 80/10/10
- n\_estimators: Grid Search (Use k-fold validation)
- max\_depth: Grid Search (Use k-fold validation)
- max\_features: Grid Search (Use k-fold validation)
- min\_samples\_leaf: Grid Search (Use k-fold validation)
- min\_samples\_split: Grid Search (Use k-fold validation)

# Hyperparameter Tuning

Grid search completed on undersampled balanced training data set with 5-fold cross validation

| Grid # | max_depth | max_features | n_estimators | min_samples_leaf | min_samples_split | Accuracy |
|--------|-----------|--------------|--------------|------------------|-------------------|----------|
| Grid 1 | 5         | 5            | 100          | 2 (default)      | 1 (default)       | 0.4375   |
| Grid 2 | None      | 5            | 200          | 2 (default)      | 1 (default)       | 0.5358   |
| Grid 3 | None      | sqrt         | 50           | 2 (default)      | 1 (default)       | 0.5273   |
| Grid 4 | None      | sqrt         | 50           | 1                | 4                 | 0.5293   |

#### **Final Model Parameters**

- Model Type: Random Forest
- Training/Testing/Validation Split: 80/10/10
- n\_estimators: 50
- max\_depth: None
- max\_features: 'sqrt'
- min\_samples\_leaf: 2 (default)
- min\_samples\_split: 1 (default)
- class\_weight='balanced' (to address data imbalance)

### **Model Performance**

- Test set accuracy of 82.84 %
- Validation set accuracy of 82.91%

| Outcome | Precision | Recall | F1-score | Support |
|---------|-----------|--------|----------|---------|
| 1       | 0.50      | 0.22   | 0.30     | 5407    |
| 2       | 0.86      | 0.95   | 0.90     | 404588  |
| 3       | 0.41      | 0.14   | 0.21     | 57972   |
| 4       | 0.29      | 0.31   | 0.30     | 11049   |

## Variable Importance

| Variable            | Importanco |   | <u></u> |       |       | Feature Imp | ortance |       |       |       |
|---------------------|------------|---|---------|-------|-------|-------------|---------|-------|-------|-------|
| Variable            | Importance | Pressure(in) -<br>Temperature(F) -  |         |       |       |             |         |       |       | -     |
| Pressure(in)        | 0.17       | Humidity(%) -<br>Hour of Day -<br>Month -<br>Wind Speed(mph) -<br>Day of Week -<br>Vietbility(m) -        |         |       |       |             |         |       |       |       |

#### **Findings - Pressure and Temperature**

• Lower Pressure and Temperatures had more severe accidents

# Findings - Humidity and Wind Speed

• Higher humidity had more severe accidents

 Accidents with a severity of 3 have a higher median wind speed

## Findings - Month and Hour

- High frequency in severity 2 accidents in the months of November through January
- Severity 3 accidents increase around April to June

 Accidents with a severity of 2 and 3 occur most often during morning and afternoon commute hours

#### Conclusion

- Potential for the predictive model to utilize real-time weather measurements like pressure, temperature, humidity, and wind speed to issue alerts to the public of hazardous conditions
- Media campaigns during high-accident risk times can help drivers be mindful of their driving
  - Safe driving messages on the morning news
  - PSA during winter with winter driving tips
- Challenges with predicting the most severe accidents but benefit of reducing overall accident frequencies

#### Limitations

- The computational requirements for our large dataset were not met, resulting in extensive code execution times. The follow limitations were introduced:
  - Reduced performance of hyperparameter tuning using grid search
  - Oversampling methods (SMOTE) to address data imbalance were unsuccessful.
    - Undersampling was used as an alternative, and likely removed variance.
      - Severity '2' value counts went from 3,624,973 to 49,669.
- Accident severity is difficult to predict. Pulling additional data from another source may have introduced more significant variables, contributing to a better performing model.
  - Example: zip code aggregated demographic data
