

FIND THE ACCOUNTS THAT OTHER INVESTIGATORS ARE MISSING

WHY ARE OUR ASSET SEARCHES BETTER?

We are one of the very Private Investigation Companies that uses blockchain transaction searches. Over 35% of banks now only use blockchain for ledger transactions. Blockchain is very different than a database like Check-Systems. You can't just access a database to find an account.

Blockchain tracking has stumped most asset location companies out there... But not us.

The reason is that if a company is just now trying to start tracking blockchain, it's not possible because of the way it must be tracked. Blockchain tracking is not performed like a normal bank search. To locate bank accounts from a bank using blockchain, you need to collect the data since the first transaction on the platform that started it. Our asset search specialists use one of the largest databases in existence on multiple platforms including IBM, Chain, Eris, and Intel and started this transaction ledger in 2014, at the start of these platforms. Normal bank locates are obtained from the data sent to the "middlemen" in banking institutions that process transactions. However, banks using blockchain cut out the middlemen which causes those bank accounts to be missed.

To sum it up, the only way is to start the required data ledgers is from the first block in the chain of transactions and follow the ledger sequentially. The chain can be easily tracked IF you hold the beginning transaction of blocks. Without the original ledger, you can't locate accounts. This technology has already advanced beyond the capabilities of any entity that did not start their ledger at the beginning of the software platform.

Our asset search specialists have been tracking blockchain since the beginning and get the best results to prove it.
