A radio presenter died due to complications from the AstraZeneca Covid-19 vaccine, a coroner has found.

Lisa Shaw, who worked for BBC Radio Newcastle, died at the age of 44 in May after developing headaches a week after getting her first dose of the vaccine.

Newcastle coroner Karen Dilks heard Ms Shaw suffered blood clots in the brain which ultimately led to her death.

The coroner said: "Lisa died due to complications of an AstraZeneca Covid vaccination."

In a statement, Dr John Holmes who treated her said she complained of having a "severe headache shooting and stabbing" across her forehead and behind her eyes.

Scans showed she had suffered a haemorrhage in the brain and after her condition deteriorated, **part of her skull was removed to try and relieve the pressure inside her head.** Her condition continued to worsen and despite more surgery and treatments, she died on 21 May.

After the hearing, Ms Shaw's family said in a statement:

"This is another difficult day in what has been a devastating time for us. The death of our beloved Lisa has left a terrible void in our family and in our lives. She truly was the most wonderful wife, mum, daughter, sister and friend."
