

## Why are clean rivers important?

- Check out the various creatures that live in rivers and streams on our picture sheets. **Cut them out**.
- Create a **split view display** of life above and below the water (see the example on the left).
- Use the **River Rescue** sheet to explore the issues that threaten freshwater wildlife.
- Add plant life, rocks and a river bed to your display.

## **Extend your learning!**

- A free downloadable e-book at www.livingworldeducation.com/explorers will give more information about the wild- life of streams and rivers with a short quiz!
- www.livingworldeducation.com/ukhabitats will give more information about the species, ID guides and conservation issues on this topic.

## RIVER RESCUE

Our rivers are in great peril. Not a single UK river is classed as having overall good health. The wildlife living in and around them are threatened by a number of issues that include...

- Pollution from untreated sewage discharged in to rivers poisons wildlife.
- Climate change increases the water temperature, so water hold less oxygen.
- Extreme weather: Increased flooding disrupts wildlife and dry, hot periods result in low water levels (further impacted by water being drawn from rivers)
- Habitat loss from human developments.
- Chemical nutrients from some intensive farming cause algal blooms which poison waters and removes oxygen, killing aquatic life.

Have a discussion with your Wildlife Club. You will have a local Member of Parliament (MP) who you can write to. You may wish to ask what they are doing about this?
