

# To Whom It May Concern.

October 9, 2019

By Rich Mancuso

## Hi there,

You're probably wondering why this link was sent to you. First, let me put you at ease. Your friend, relative, or potential partner is not

dying or gravely ill, and it's nothing that is life-threatening. However, they sent you here because they are apprehensive about telling you something of a very private and sensitive nature.

Human beings love to share secrets, and it is also very common to share intimate affairs about ourselves with someone we wish to be with physically or mentally. Whether it's a short term relationship, a life mate, or just a great friend to confide in, this sharing is based on an effort to be honest. The fact you are reading this means that someone sees value in you and a great deal of trust. So what is this big secret you ask? Well, it's a small word that can carry a lot of weight, and one that almost everyone on the planet already has....it's called herpes.

I hope you are still here, and I am also hoping you are someone who understands a little bit about it. Did you know that it is pretty much everywhere? Billions of people have herpes simplex; ever heard of a cold sore? Yes, that's herpes, and sometimes the same [virus](#) can be on your private parts. This happens more often than people think.

## **Allow me to put this into perspective.**

Most people have been made aware of this common virus in grade school during sex-ed class. It's a safe bet that many of the facts you learned have already been forgotten, but the laughter and jokes remain. We get it; it happens all the time. Regardless, a lot of information has changed since those young, carefree days and the viewing of scary pictures in the classroom and feeling invincible.

Most human beings exposed to this 5 to 6 million-year-old virus are entirely unaware they have it and rarely see any symptoms or outbreaks (ex; cold sores). We are talking approx—6+ billion people walking around with herpes... every single day. The [real reason](#) that most will never see evidence of this infection taking place is that most humans have a significant immune response to the virus (some will even [test negative](#)).

Remember when we talked about the scary pictures of herpes outbreaks from high school? Those are the worst-case scenarios. While it's true that some people can experience these types of symptoms, they generally occur within people who have an autoimmune issue or are immune-compromised.

## It's just Herpes...

Please keep in mind that whoever sent this to you has done so out of honesty, respect, and kindness. They care about their sexual health, and they are hoping that you care about yours as well. Unfortunately, the same consideration is not shown in return for many who share their herpes status with others; this happens more than I care to admit. They see you as a person of worth, value, and one who should be allowed to make a choice, seems fair, right? Perhaps you will see them as a better person, not as someone trying to hide something from you. Regardless, I cannot predict what choice you will make, but I can ask that you please keep these points in mind if you wish to stop any further communications or decline any romantic interest. Rejection can be a hard emotion to deal with, but how you respond and what you do next is entirely up to you...
