

Screen Innovations TRO.Y Motorized Screen/Shade Control Gateway

Screen Innovations TRO.Y Motorized Screen/Shade Control Gateway

Screen Innovations has in recent years applied its creative engineering resources to building motorized shades and support electronics. TRO.Y is a clever extension of that work as well as a unique solution for quickly programming motorized screens, especially multiples of motorized screens in the same facility. Hours of time typically associated with programming on a dedicated PC to synchronize screen motors, establish setpoints, and integrate with automation systems is reduced to minutes spent in a single self-contained interface that is accessible via any web-enabled device. Programming can be handled prior to installation, and post-install adjustments are easily made on site. For large, multi-screen installs, a unique ID address can be assigned to an entire group of screens, eliminating redundant programming. Troy integrates seamlessly with SI's range of 485, Zigbee 3.0, and RTS screen motors, and facilitates connectivity with control systems from leading manufacturers including Control4, Crestron, Savant, and others.
