2025-2026 Salt/Ice Melt Product Information

**Here are helpful
definitions
for the most
common
ice melting
additives:**

Sodium Chloride – Often known as rock salt, this common de-icer is effective at melting ice in moderate temperatures (above 15°F) and is cost-effective, but it can be corrosive to concrete and metal surfaces.

Calcium Chloride – This fast-acting de-icer works at much lower temperatures (down to -25°F) and can penetrate ice quickly. It's more effective than sodium chloride but may be more expensive. ***Harsh to skin and pets!***

Magnesium Chloride – Effective in temperatures as low as -13°F, magnesium chloride is less harsh on concrete and plants than some salts, though it can still cause minor corrosion over time. ***Best for pets when used as directed.***

Calcium Magnesium Acetate – CMA is a deicer and can be used as an alternative to road salt. It is approximately as corrosive as normal tap water, and in varying concentrations can be effective in stopping road ice from forming down to around -17.5 °F.
