Technology

Nuclear power generation has had its chance, time for "new" renewables!

BUSTED!

Nuclear power is a renewable source of energy with a very low carbon footprint. And now is the time for both nuclear power and "new" renewables.

Both forms of technology are required to meet our Net Zero targets.

MYTH

Technology

Nuclear is not compatible with
renewable energy.

BUSTED!

Nuclear is flexible and can adjust electricity production depending on need, in the same way as gas power plants.

Nuclear and renewables are both low carbon sources of energy. In times of low demand, reactors at full power can divert their energy to be used in the production of hydrogen and synthetic fuels to help decarbonise aviation and transport (in addition to other sectors where decarbonisation is difficult).
