

The proprietary Adaptive Risk Model (ARM) identifies deficiencies, measures potential business impact, and recommends prioritized remediation actions. However, sometimes you have to walk before you run. At Cyturus we are now offering our Domain expertise as a service.

Identify key Domains which need immediate attention and we will deliver answers. The engagement cycle results in a customized package of rank-ordered tactical remediation actions to mitigate the associated business risks while accurately quantifying cybersecurity ROI for your organization.

From a strategic perspective, Cyturus believes an holistic enterprise risk assessment is the best approach to program maturity. However, taking on an overall maturity model requires total executive commitment. In these times, projects that create quick wins are vital. That is why Cyturus has launched a group of micro assessments.

Each assessment is based on our proprietary ARM methodology and derived from our core domains and subdomains. All of these services are a critical part of an overall risk maturity game plan. Any of these services can later be ingested into the Cyturus ARM framework for deeper examination and lateral impact in a future engagement.
