24 2 YR OLD POLL HEREFORD BULLS 24

(ALL BULLS USED AS YEARLINGS AT DALKEITH)

**All Bulls are available for inspection at any time
by phoning - Ant Martin on 6376 4624**

51st Annual Spring Sale

**THIS AUCTION IS AN
AUCTIONS PLUS ONLINE SALE ONLY
WHICH WILL RUN FROM 1.30pm TO 2.30pm.**

BULLS WILL BE YARDED AT TANGARATTA ON SALE DAY FOR INSPECTION.
LUNCH AND MORNING TEA WILL BE PROVIDED.

WE WILL ALSO HOLD A INSPECTION DAY FOR THE BULLS, TO BE HELD ON SATURDAY 28th OF AUGUST 2021.
TO BE HELD AT "TANGARATTA" FROM 10.00AM TO 4.00PM LUNCH AND MORNING TEA TO BE PROVIDED.

COVID-19 SAFETY WILL BE OBSERVED BOTH DAYS. DUE TO THE ADVANCING COVID WE ARE AVAILABLE FOR
PRIVATE INSPECTIONS AT ANY TIME PRIOR TO SALE DAY. CONTACT ANT AT 02 6376 4624 OR 0427 761 123.

HERD HEALTH STATUS: 3 x 7-1, Vibrio, Pesti Virus Vaccines - All bulls have 3 doses JBAS 7

POLL HEREFORDS & HEREFORDS

Information: Things have improved over the last two years.

We now have what you would call a very select group of cattle.

We have a very good bull sale team. We also have a very select group of young bulls for next year's production. We have just about finished calving the 120 heifers and cows for this year and I think we have the makings for a great line of bulls in 2023. We also see the commencement of a building program for the female herd in these calves.

Our 2021 bull sale will be a sale held by Auctions plus on Thursday 9th of September 2021. We will have the bulls available for inspecting any time between now and sale day.

Represented in this year's bulls will be 11 sires again showing the use of a large genetic base in our herd. Bulls by Allendale Barkly H127, Injimira Anzac H006 M187, Bowen Calibre K68, Kerison pines Keystone M004, Mountain Valley Gambler G14 and many Dalkeith young sires.

As has been in the past all Dalkeith sale bulls have had a joining to cows or heifers before they are sold this year.

In holding our sale by Auctions Plus we still intend to put out a catalogue of the bulls and the bulls will be available for inspecting at any time.

We will hold an open day on Saturday 28th of August 2021, this day will be held at Tangaratta and the bulls will be yarded this year and not out in the green oats paddocks as was the case last year. Lunch and morning tea will be provided each day. On sale day we will also yard the bulls for inspection and we will have available the facilities to bid on Auctions plus.

We are pleased to say that our best bull calf for 2021 is by our top priced bull in 2020, Dalkeith Prince ACMP041.

Please don't hesitate to contact Ant Martin should you have any inquiries regarding the 2021 Dalkeith bull sale.

This will be the last group of bulls bred by ET at Dalkeith and we would like to thank Ian Durkin for the ET programmes we shared together. There are 5 bulls in the sale that are out of Mountain Valley females.

Mountain Valley had a very successful sale with 41 Poll Hereford bulls selling for an average of \$15,268.00.

Due to the advancing Covid-19 within the state we will be available for private inspections any time prior to sale day by calling Ant on 02 6376 4624 or 0427 761 123.

Can't stay for the whole sale? Set your maximum bid on the lot that you want to purchase and let the computer bid for you.
- 6 CONTACT SELLING AGENT**
If successful, contact selling agent to arrange payment and delivery. The agent contact details will be available in the catalogue header.
- 7 PAYMENT**
Via the selling agent's terms and conditions.
- 8 DELIVERY**
Arrange transport of livestock at your expense.

EXPLANATORY NOTES OF EBV'S

The EBVs contained within this catalogue can be validly compared with other Hereford GROUP BREEDPLAN EBVs in other herds. These EBVs cannot be used to compare animals of another breed.

ESTIMATED BREEDING VALUES (EBVs)

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These are called Estimated Breeding Values (EBVs). The EBV is therefore the best estimate of an animal's genetic merit for that trait. EBVs are expressed as the difference between an individual animal's genetics and the genetic base to which the animal is compared.

ACCURACY

An accuracy value is presented with every EBV and gives an indication of the amount of information that has been used in the calculation of that EBV. The higher the accuracy, the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives.

Accuracy Range	Interpretation
Less than 50%	The EBVs are preliminary. EBVs in this range will have been calculated based on very little information. These EBVs could change substantially as more direct performance information becomes available on the animal.
50 – 74%	The EBVs are of medium accuracy. EBVs in this range will usually have been calculated based on the animal's own performance and some limited pedigree information.
75 – 90%	The EBVs are of medium-high accuracy. EBVs in this range will usually have been calculated based on the animal's own performance coupled with the performance for a small number of the animal's progeny.
90% and above	The EBVs are a high accuracy estimate of the animal's true breeding value. It is unlikely that EBVs will change considerably with addition of more progeny data.

CALVING EASE

Calving Ease EBVs are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

Direct: Direct calving ease indicates how this animal influences the birth of its progeny.

Daughters: Calving Ease-Daughter's indicates how well the animal produces daughters that have easier calving.

BIRTH

Gestation Length: The GL EBV (days) is based on AI records. Lower (negative) GL EBVs indicate shorter gestation length and generally easier calving.

Birth Weight: The Birth Weight EBV (kg) is based on the measured birth weight of animals, adjusted the dam age. The lower the value, the lighter the calf at birth & the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

FERTILITY

Scrotal Size: The SS EBV (cm) is an indicator of male fertility in regards to semen quality and quantity. Higher (positive) EBVs indicate higher fertility. SS is also positively associated with female fertility.

Days to Calving: The DC EBV (days) is an indicator of female fertility based on the time between a cow's first exposure to a bull and when she subsequently calves. Cows that calve late in the season or fail to calve are penalised. This is more useful as a sire trait. Lower (negative) EBVs are preferred indicating shorter days to calving for the sire's daughters.

GROWTH

Milk: 200-Day Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV is indicative of their daughter's milking ability as it affects the 200-day weight of their calves.

200-Day Growth: The 200-Day EBV (kg) is calculated from the weight of animals taken between 80 and 300 days of age. Values are adjusted to 200 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight: The 400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight: The 600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Mature Cow Weight: The Mature Cow Weight EBV (kg) is an estimate of the genetic difference in cow weight at 5 years of age. Smaller or more moderate EBVs are generally more favourable.

CARCASE

Carcase Weight: The Carcase Weight EBV (kg) estimates the genetic difference in carcase weight at a standard age of 650 days.

Eye Muscle Area: The EMA EBV (cm²) estimates genetic differences in eye muscle area at the 12/13th rib site of a 300kg dressed carcase. More positive EBVs indicate better muscling on animals.

Rib Fat: The Rib Fat EBV (mm) estimates the genetic differences in fat depth at the 12/13th rib in a 300kg dressed carcase. More positive EBVs indicate more subcutaneous fat and earlier maturity.

Rump Fat: The Rump Fat EBV (mm) estimates the genetic differences in fat depth at the P8 site of a 300kg dressed carcase. More positive EBVs indicate more subcutaneous fat and earlier maturity.

Retail Beef Yield %: The RBY% EBV (%) represents total (boned out) meat yield as a percentage of a 300kg dressed carcase. A more positive EBV indicates higher percentage yield for the 300kg carcase size.

Intramuscular Fat %: The IMF% EBV (%) is an estimate of the genetic difference in the percentage of intra-muscular fat at the 12/13th rib site in a 300kg carcase. Depending on market targets, larger more positive values are generally more favourable.

SELECTION INDICES

Southern Self-Replacing Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing purebred Hereford herd targeting the domestic market. Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 18 months of age to produce 300 kg carcasses with 10 mm P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period which results in small increases in cow weight.

Northern Self-Replacing Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial self-replacing herd targeting the domestic market. This index is suitable for use by both straight bred Hereford herds and in crossbreeding programs where Hereford bulls are being used over a Bos indicus based cow herd. Daughters are retained for breeding and so maternal traits are of importance. Steers are slaughtered at 18 months of age to produce 340 kg carcasses with 12 mm P8 fat depth. A high cost is applied for cow feed costs during the annual feed shortage period which produces little change in mature cow weight.

Southern Baldy Maternal Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd using Hereford bulls over Bos taurus females (e.g. Angus). A portion of the heifers are retained for breeding and so maternal traits are of importance. The steers and surplus heifers are destined for slaughter at 18 to 19 months of age. Steers produce 300 kg carcasses with 10 mm of P8 fat depth, while heifers produce 270 kg carcasses with 12 mm of P8 fat depth. A moderate cost is applied for cow feed costs during the annual feed shortage period which results in small increases in cow weight.

Northern Baldy Terminal Index – Estimates the genetic differences between animals in net profitability per cow joined in a commercial crossbred herd using Hereford bulls over Bos indicus females (e.g. Santa Gertrudis) where all progeny (male and female) are destined for slaughter. Steers and heifers are slaughtered at 18 to 19 months of age. Steers produce 340 kg carcasses with 14 mm of P8 fat depth while heifers produce 300 kg carcasses with 17 mm of P8 fat depth.

Further details will be made available upon the release of the new Herefords Australia selection indexes in October 2019.

The Hereford GROUP BREEDPLAN Estimated Breeding Values contained in this Sale Catalogue were compiled by the Agricultural Business Research Institute (ABRI) from data supplied by the breeders. Neither Herefords Australia Limited nor the ABRI oversee or audit the collection of the data.

The “Completeness of Performance” Herd Rating System

The “Completeness of Performance” herd rating system assesses the quantity of pedigree and performance information that has been submitted to BREEDPLAN by an individual seedstock herd.

While ultimately EBV accuracy values provide an indication of the reliability of an animals EBV’s, one of the key factors underpinning the accuracy of EBV’s is the quantity of performance information that has been recorded with BREEDPLAN by a herd.

The star rating for a herd is calculated based on the proportion of calves within the herd born in a fixed five year period that have performance recorded for each trait. Different criteria are used within each individual breed depending on the traits for which EBV’s are calculated within the breed. Each herd receives a star rating on a 0 – 5 scale (including half stars) that summarized the relative “completeness” of their performance information.

Following is a description of each star rating:

Star Rating	Description
5	Herds with a star rating of “5” are gold standard. They are considered to be recording “complete” performance information with BREEDPLAN for all animals across all traits for which EBV’s are available.
4 or 4.5	Herds with a star rating or “4” or “4.5” are silver standard. They are considered to be recording comprehensive performance information with BREEDPLAN for most animals and traits, but are recording less performance than a 5 star herd.
3 or 3.5	Herds with a star rating of “3” or “3.5” are considered bronze standard. They are considered to be recording performance information with BREEDPLAN for a reasonable number of traits or animals, but are recording less performance information than a 4 or 5 star herd.
2.5 or less	Herds with a rating of “2.5” or less are recording information with BREEDPLAN but not for all animals or traits. They are recording less performance information than a 3, 4 or 5 star herd.
