METRx® II
System

The objectives and indications for surgery using the METRx® II System are the same as conventional open surgery. This is accomplished by applying traditional surgical techniques through a Tubular Retractor under loupes, microscopic or endoscopic visualization. Utilizing the specially-designed instrumentation in the METRx® II System, a laminotomy, medial facetectomy, foraminotomy, discectomy, PLIF, TLIF, posterior lateral fusion, and even pedicle screw insertion can be performed in a minimally invasive fashion.

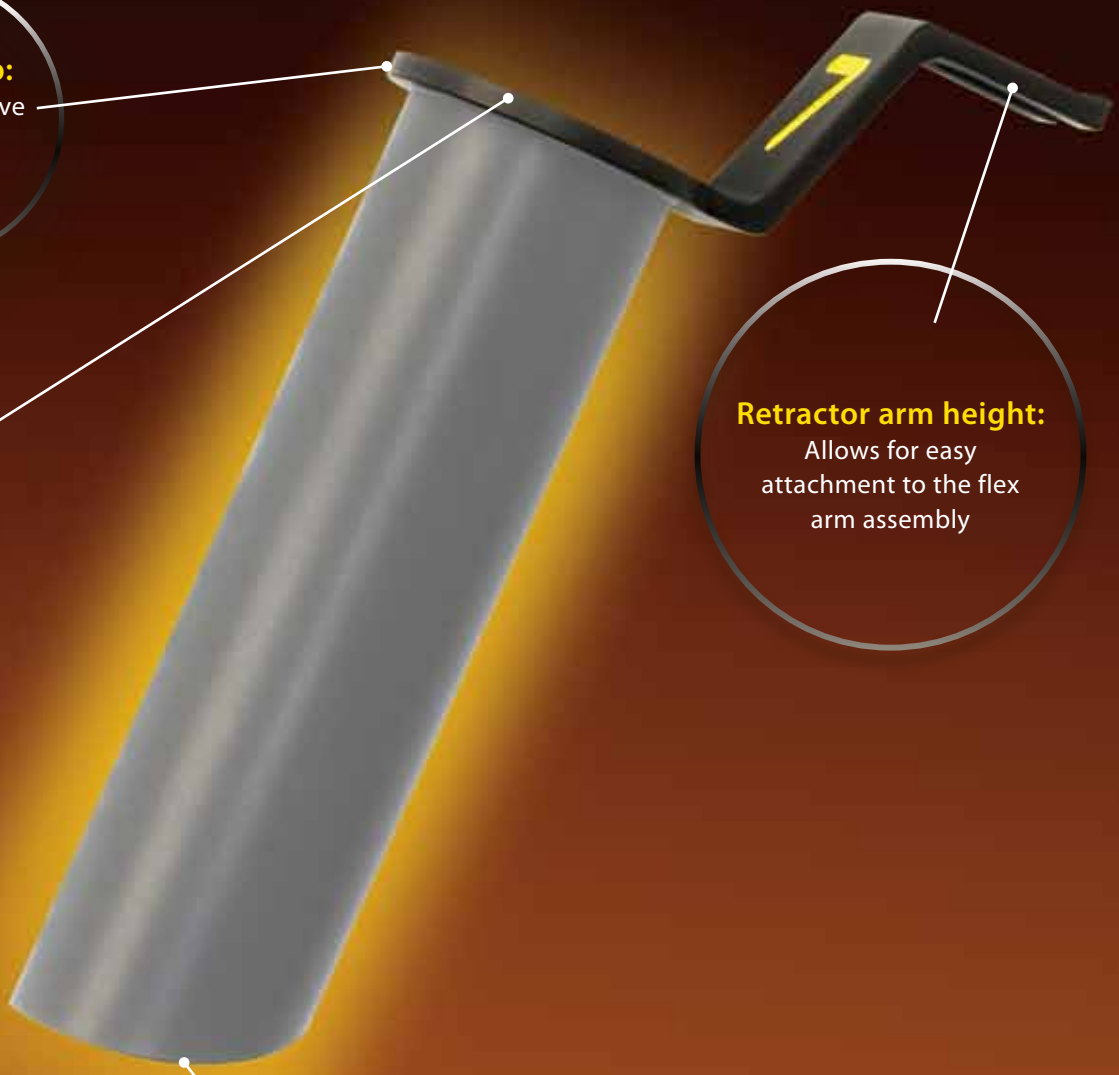
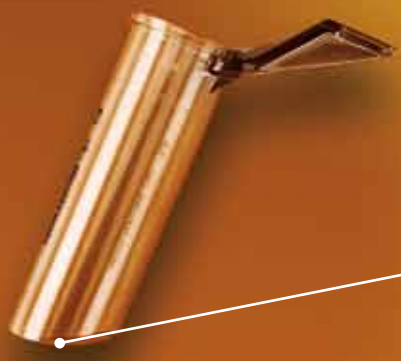
Important Product Information	37



Rounded lip:
For intraoperative visualization

PVD coating:
Reduces glare from the light source

Retractor arm height:
Allows for easy attachment to the flex arm assembly



20 degree beveled tip:
Permits docking onto the lamina

Available in 14mm, 16mm, 18mm, 20mm stainless
Available in 18mm (only) disposable

Clear visibility of the labeling:
Helps reduce back table confusion
4/90
4/90
Ejector tip:
Engineered to remove bony tissue

Dual-Sided Penfields
Streamlined instrumentation
(push/pull feature)

Sucker #12
Large sucker diameter
for increased suction

4mm Pituitary Rongeur
Large rongeur for greater bone
biting capacity

Wide Suction Retractor
Large sucker diameter and
retracting feature

Cases

Streamlined packaging maximizes surgical flexibility, while minimizing the number of cases needed for surgery

Instrument Set
Includes standard and micro instruments

Tubular Retractor Set

Flex Arm and Dilator Set

Bipolars

Non-Stick Material:
Eliminates soft tissue sticking to instrumentation

Micropituitaries

Provide durability to meet the demanding needs of surgeons and complex procedures

Flex Arm

Innovative Design:
Provides increased rigidity and two independent working planes through new ball joint locking mechanism. In addition, allows the docking of additional instruments, including a self retaining nerve root retractor

Handles

Color Coded: Provides medical staff a visual reference to instrument size, helps reduce back table confusion
Available on all kerrisons, curettes, and pituitaries

Silicone: Provides for an ergonomic handling of the instruments
Available on all kerrisons, curettes, and pituitaries

Preliminary Steps: Targeting

Targeting Using the METRx® II System

A METRx® II System procedure is initiated by inserting a spinal needle into the paraspinal musculature at the appropriate distance off the midline toward the bony anatomy. The placement is confirmed using lateral fluoroscopy.

Procedure	Landmark Docking Point
Discectomy, Laminectomy, Stenosis	Inferior Aspect of the Superior Lamina
PLIF	Medial Aspect of the Facet
Pedicle Screws	Transverse Process/ Facet Junction
TLIF	Lateral Aspect of the Facet
Cervical Foraminotomy	Medial Facet/Laminar Junction
Far Lateral	Junction of TP and Pars of Superior Vertebra

(See Figure 1)

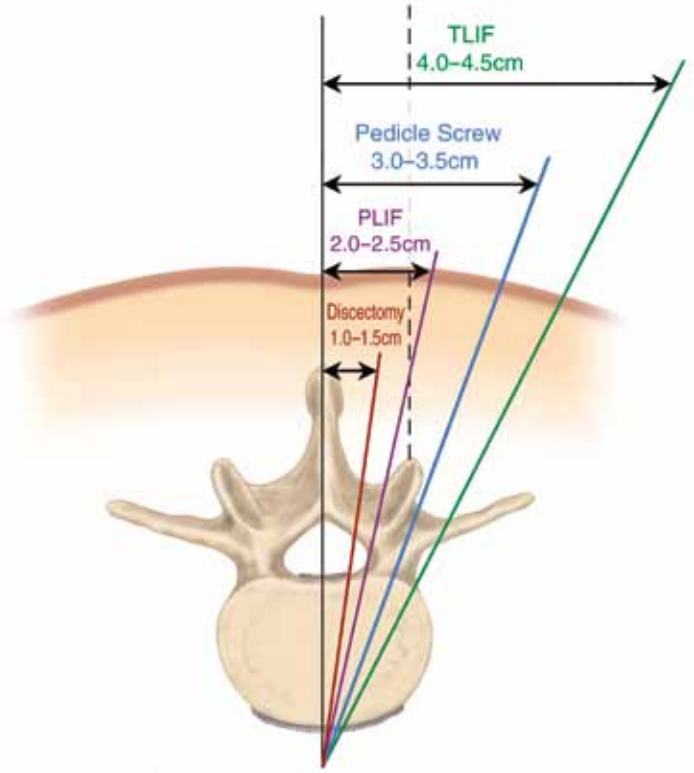

Figure 1

Guidewire Insertion

The spinal needle is removed and a vertical incision is made at the puncture site. The incision length should match the diameter of the respective Tubular Retractor—14mm Tubular Retractor, 14mm incision, and so on.

Some practitioners also incise the fascia to make tissue dilation easier. This is optional and can be performed later if tissue dilation is difficult.

The Guidewire is placed through the incision and directed toward the appropriate anatomy under lateral fluoroscopy. The Guidewire is advanced only through the lumbodorsal fascia. Great care must be taken to avoid penetration of the ligamentum flavum and inadvertent dural puncture with possible nerve injury or spinal fluid leak **(Figures 2a, 2b, and 2c)**.

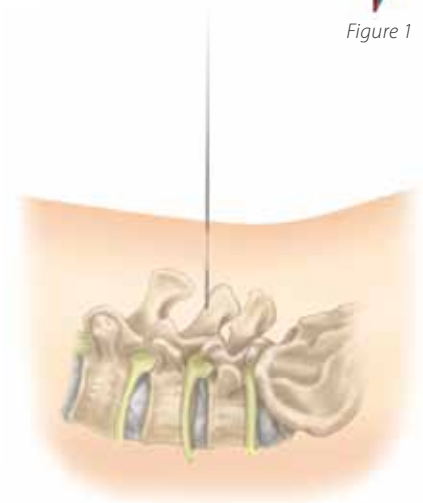

Figure 2a

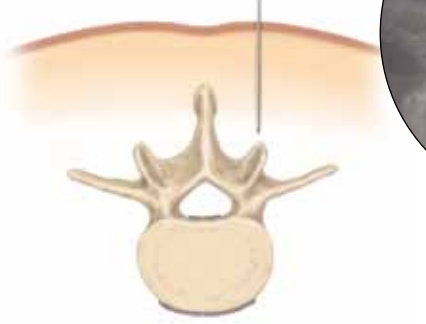

Figure 2b

Figure 2c

First Dilator Insertion

Insert the cannulated soft tissue Dilator over the Guidewire using a twisting motion. Once the fascia is penetrated, remove the Guidewire and advance the Dilator down to the bony anatomy **(Figure 3)**.

Use the initial Dilator to palpate the anatomy in both the coronal and sagittal planes **(Figure 4)**. This maneuver confirms an appropriate approach laterally and helps expedite soft tissue removal.

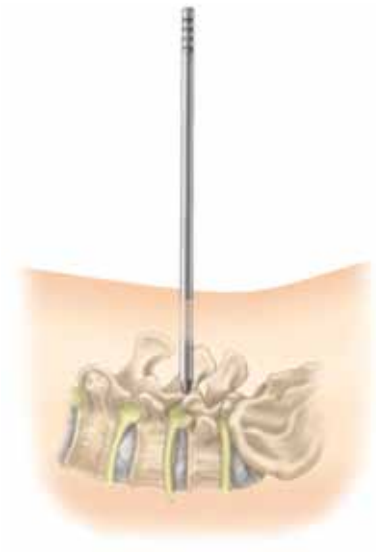

Figure 3

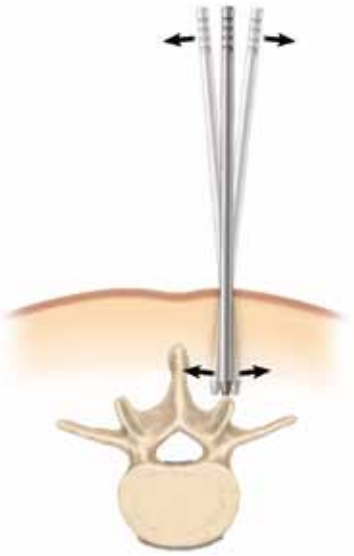

Figure 4

Sequential Dilation and Tubular Retractor Insertion

The next series of Dilators are sequentially placed over each other. Only use the number of Dilators required to get to the preferred Tubular Retractor diameter. The depth markings on the Dilators are noted to indicate the Tubular Retractor length appropriate to the patient's anatomy **(Figure 5)**.

The optimum Tubular Retractor is placed over the sequential Dilators and seated firmly on the bony anatomy. The Flexible Arm is attached to the bed rail and the selected Tubular Retractor.

The Flexible Arm is secured and the sequential Dilators are removed, establishing a tubular operative corridor.

Figure 5

Repositioning the Tubular Retractor

If repositioning of the Tubular Retractor is necessary, the Retractor can be moved or angled over the pathology by a process known as wanding. Insert the matching color Dilator into the tube. While downward pressure is placed on the Tubular Retractor, the Flexible Arm is unlocked, allowing the Tubular Retractor to be pivoted over the desired location **(Figure 6)**.

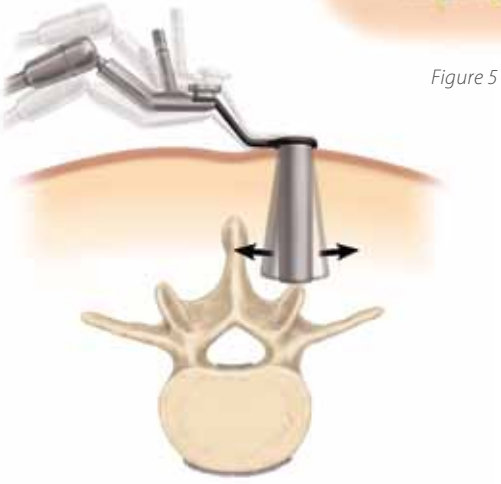

Figure 6

See Preliminary Steps: Targeting information on page 20 for steps that precede this technique.

Spinal Fusion Procedure using the METRx® II X-TUBE® Retraction System

METRx® II X-TUBE® System Introduction

A METRx® II X-TUBE® Retractor is selected in accordance with exposed markings on the final Dilator **(Figure 7)**. The METRx® II X-TUBE® System is then inserted over the Dilators and seated firmly flush with the bony anatomy and locked in place with the Flexible Arm. The Dilators are then removed, establishing a tubular operative corridor.

Figure 7

METRx® II X-TUBE® System Deployment

The METRx® II X-TUBE® Instrument is deployed by inserting the Opener Instrument in the tube and compressing the Opener Instrument handle **(Figure 8)**.

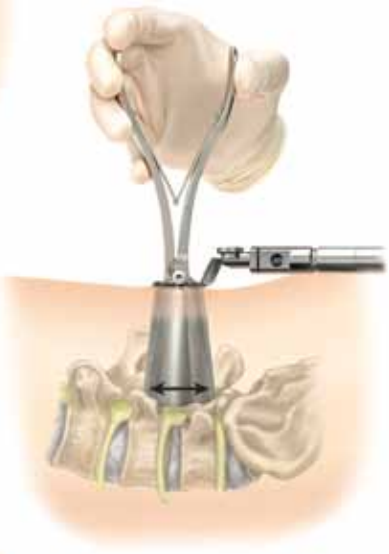

Figure 8

Pedicle Preparation

Inferior and superior pedicles may now be targeted **(Figure 9)**.

Figure 9

Screw and Rod Insertion

For screw and rod insertion and compression/distraction instructions, please refer to the CD HORIZON® LEGACY™ System surgical technique.

METRx® II X-TUBE® System Extraction

The METRx® II X-TUBE® instrument is closed by turning the Opener instrument 90° so the stops are perpendicular to the hinges. The Opener is then compressed, causing the METRx® II X-TUBE® instrument to collapse **(Figure 10)**.

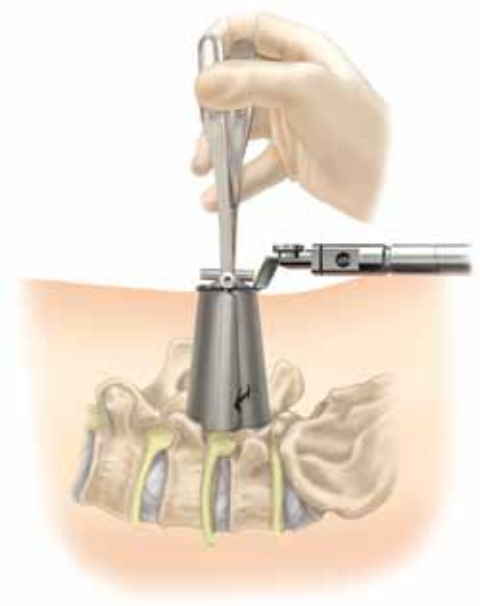

Figure 10

See Preliminary Steps: Targeting information on page 20 for steps that precede this technique.

Lumbar Stenosis using the METRx® II System

Decompression

In preparation for a spinal stenosis procedure, insert the appropriate size METRx® II System Tube as described in earlier steps of the technique. Once the Tube is positioned, it is important to extend the laminotomy cephalad above the insertion of the ligamentum flavum. This is to ensure resection of all hypertrophied ligamentum. After the cephalad border of the ligamentum is exposed it can be separated from the dura using Angled Curettes or a right or left Ball Tip Dissector **(Figure 11)**. The ligamentum is then resected with a 90° or 40° Kerrison Punch **(Figure 12)**. To ensure complete decompression of the lateral recess, the lateral exposure should allow palpation of the inferior pedicle. This often requires resection of the superior border of the lower lamina **(Figure 13)**. It will also remove any caudal residual ligamentum, which often can compress the dura or nerve root. Foraminotomies are then performed, as necessary, to decompress both exposed foramina **(Figure 14)**. The Ball Tip Probe should be able to pass freely into both the cephalad and caudal foramina.

After achieving the ipsilateral decompression, a separate contralateral exposure may be utilized to decompress the opposite lateral recess by following the aforesaid procedural steps **(Figure 15)**.

Figure 11

Figure 12

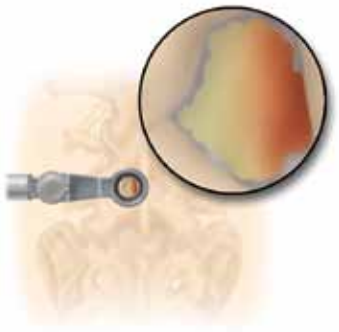

Figure 13

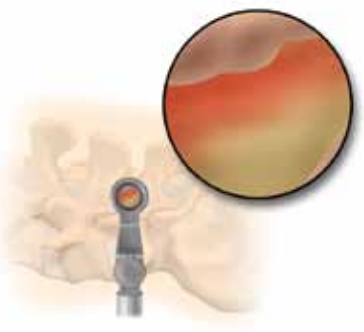

Figure 14

Figure 15

Contralateral Decompression from an Ipsilateral Approach

As an alternative to contralateral decompression from the contralateral side, an ipsilateral approach to contralateral decompression can be used. After completion of the ipsilateral decompression, the Tubular Retractor is angled medially to expose the anterior spinous process. A drill can then be used to resect the anterior spinous process and the medial aspect of the contralateral lamina **(Figure 16)**. This exposes the contralateral hypertrophied ligamentum flavum, which can then be resected using Kerrison Punches and Curettes **(Figures 17a, 17b and 17c)**. Care is taken to palpate the caudal pedicle and probe both the cephalad and caudal foramina to be certain that the decompression is complete **(Figure 18)**.

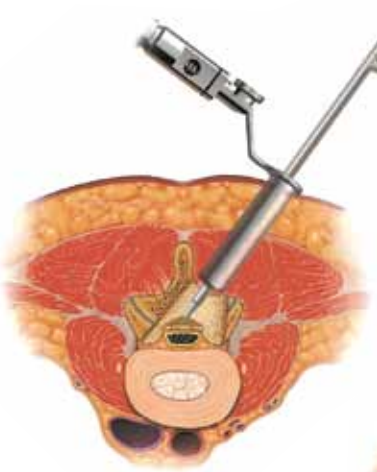

Figure 16

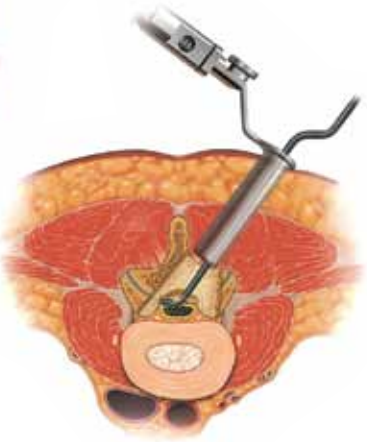

Figure 17a

Figure 17b

Figure 17c

Figure 18

See Preliminary Steps: Targeting information on page 20 for steps that precede this technique.

Discectomy using the METRx® II System

Soft Tissue Removal and Laminar Identification

It is essential to remove all soft tissue exposed in the operative corridor in order to maximize the working space within the Tubular Retractor. This can be accomplished with a Pituitary Rongeur and/or electrocautery.

The laminar edge is identified and the ligmentum flavum is detached from the undersurface of the lamina with a small Angled Curette **(Figure 19)**.

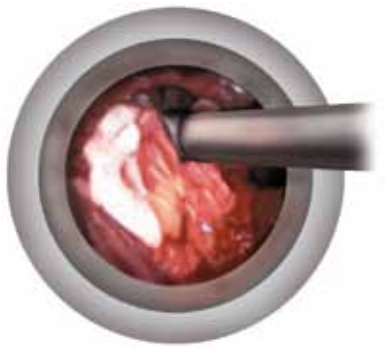

Figure 19

Laminar and Interlaminar Space Identification

A hemilaminotomy/medial facetectomy is then performed with a Kerrison Punch or high-speed drill **(Figure 20)**. Lateral recess and/or foraminal stenosis can be addressed in this fashion. Effective utilization of lateral fluoroscopy will help tailor the dissection as necessary to access specific pathology. When the decompression is done mainly for lumbar stenosis and not a disc herniation, the laminotomy is carried just cephalad to the insertion of the ligamentum flavum onto the underside of the lamina. This assures that all hypertrophied ligamentum will be removed, adequately decompressing the canal. If the pathology is beyond the confines of the Tubular Retractor, wanding can be used to reposition the Tubular Retractor.

Figure 20

Figure 21

Ligamentum Flavum Removal

The ligament is penetrated with the Curette or Ball Probe using a twisting motion under the remaining superior lamina where the ligament is thin **(Figure 21)**. It is peeled back caudally and dorsally, then resected with a Kerrison Punch **(Figure 22)**.

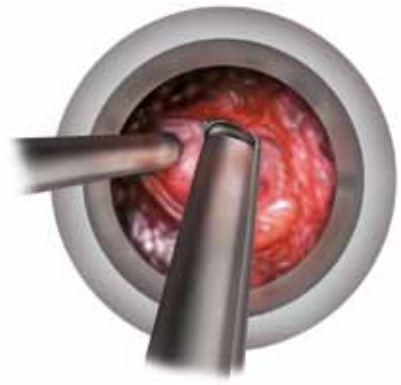

Figure 22

Nerve Root Exploration and Retraction

There is an initial tendency to "cone" the exposure down to the final target, reducing the working space and visualization in the Tubular Retractor. In order to avoid this, it is important to complete soft tissue, bone and ligament removal over the entire area of the exposure. Figure 23 shows appropriate exposure of the epidural space.

The dura and traversing nerve root are identified. The nerve root is retracted medially utilizing a Penfield Dissector, Love Style or Suction Retractor **(Figure 23)**. The volar epidural space can then be explored. If necessary, epidural veins can be cauterized with Bipolar Forceps and divided with micro scissors **(Figure 24)**. Cotton patties can also be used to obtain hemostasis.

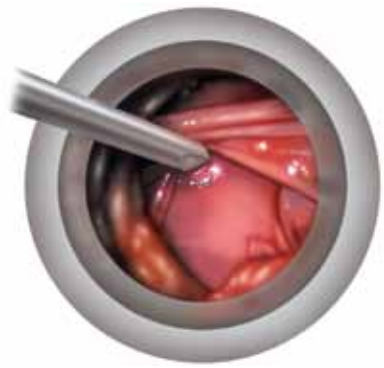

Figure 23

Figure 24

Discectomy and Closure

Identify the disc herniation. If an annulotomy is necessary, it can be accomplished with the Annulotomy Knife while protecting the nerve root with the Retractor. The herniated disc is then removed with a Pituitary Rongeur in a standard fashion **(Figure 25)**. Intradiscal and extradiscal work can be carried out as one would normally perform during an open microdiscectomy. The nerve root is explored to ensure the decompression is complete.

Once the nerve root is decompressed, irrigate the disc space thoroughly. Epidural steroids may be injected if desired. Loosen the Flexible Arm assembly and slowly remove the Tubular Retractor. Any bleeding in the paraspinal musculature can be controlled with the Bipolar Forceps as the Tube is removed.

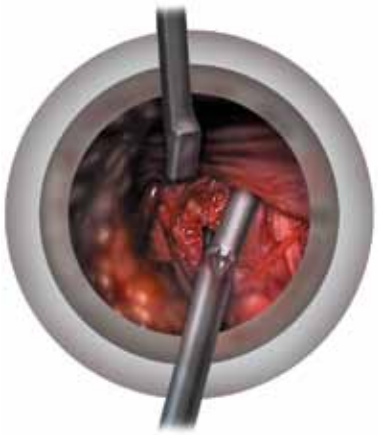

Figure 25

See Preliminary Steps: Targeting information on page 20 for steps that precede this technique.

TLIF using the METRx® II System

Soft Tissue Dilation and Bony Exposure

In a TLIF procedure, a 22mm or 26mm diameter METRx® II Tube is used to access the ipsilateral side following tissue dilation. Once the Tube is positioned, remove the superior and inferior facets using an osteotome or drill. It is important to remove the entire facet in order to provide a better view and access to the disc space. Additional bony removal may be carried out at this time using a Kerrison Rongeur or drill. Use caution not to violate pedicle walls **(Figures 26, 27, and 28)**.

Figure 26

Figure 27

Disc Removal

Incise the disc space with a scalpel and begin disc removal using a Pituitary Rongeur **(Figure 29)**. Continue disc removal using either the Straight or Curved Rotating Cutters. The Rotating Cutters are blunt tipped and side cutting to ensure safety **(Figure 30)**. A T-handle or a handheld power drill may be used for more efficient removal of disc.

Figure 28

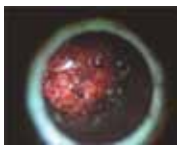

Figure 29

Implantation Steps

For Contralateral Screw Insertion, Restoration of Disc Height, Endplate Preparation, Interbody Construct Insertion, Compression and Ipsilateral Screw Insertion steps please refer to the CD HORIZON® SEXTANT® II PERCUTANEOUS PEEK Rod Insertion System surgical technique or the MAST QUADRANT™ Retractor System surgical technique. For end plate preparation and interbody construct insertion, please refer to one of our many interbody fusion device system surgical techniques.

Figure 30

See Preliminary Steps: Targeting information on page 20 for steps that precede this technique.

PLIF using the METRx® II System

Preoperative Planning

The patient is placed on the operating table in the prone position with lateral C-arm fluoroscopy. Care should be used to maintain the patient in a lumbar lordotic position.

A spinal needle is placed into the paraspinous musculature 2cm – 2.5cm off of the midline at the appropriate level and confirmed using lateral fluoroscopy (Figure 31).

The Guidewire is placed through the incision and directed toward the facet under lateral fluoroscopy.

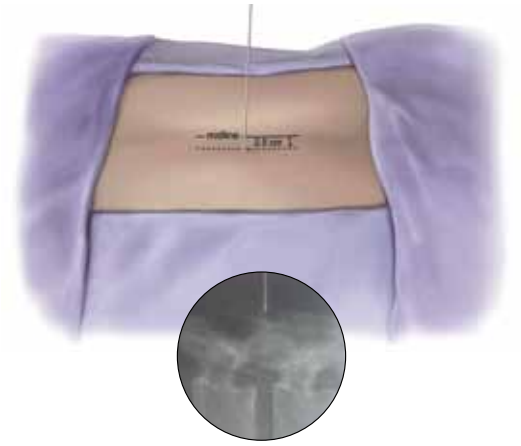

Figure 31

Dilation/Tubular Retraction

Insert initial cannulated soft tissue Dilator over the Guidewire. Once the fascia is penetrated, remove the Guidewire and advance the Dilator over the facet. Confirm the placement of the initial Dilator using lateral fluoroscopy. The next series of dilators are sequentially placed over each other. The optimum tubular retractor is placed over the sequential dilators and placed firmly on the bony anatomy.

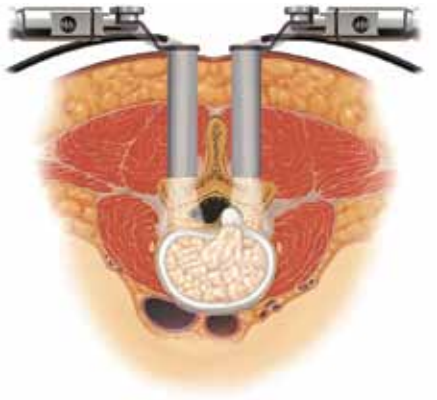

Figure 32

Laminotomy, Facetectomy, and Discectomy

A conventional discectomy is performed by incising the annulus with a 15-scalpel blade lateral to the dural sac.

This is done bilaterally and then soft fragments from the intradiscal space or extruded fragments are removed with Disc Rongeurs in a conventional fashion (Figure 32).

Implantation Steps

For Disc Space Distraction, Disc Space Preparation, Endplate Preparation, Wedge Insertion please refer to the CD HORIZON® SEXTANT® II PERCUTANEOUS PEEK Rod Insertion System surgical technique or the MAST QUADRANT™ Retractor System surgical technique. For end plate preparation and interbody construct insertion, please refer to one of our many interbody fusion device system surgical techniques.

See Preliminary Steps: Targeting information on page 20 for steps that precede this technique.

Posterior Cervical Foraminotomy using the METRx® II System

Patient Positioning and Room Set-up

METRx® II posterior cervical foraminal access is performed in a similar stepwise fashion as described in the previous posterior lumbar steps with the following exceptions:

Anatomic Location—Cervical Spine

Patient Position

The patient is placed in a Mayfield pin holder with frame extended as far as possible to allow adequate AP fluoroscopic visualization. The fluoroscope is rotated so the line of view is perpendicular to the spinal laminar line **(Figure 33)**. Generally, the fluoroscope will come in from the surgeon's right, the surgeon being seated directly at the patient's head. When the Tubular Retractor is safely docked in operating position, the fluoroscope can be moved to allow the microscope to be brought in.

Figure 33

Guidewire Insertion

A 20-gauge Spinal Needle is inserted into the paraspinous musculature approximately 1cm to 2cm off of the midline at the appropriate level. The AP fluoro will allow the surgeon to safely access the lateral mass and stay clear of the canal. A stab wound is made over the needle puncture site and the localizing Guidewire is passed down below the fascia. The Guidewire is advanced through the deep cervical fascia **(Figure 34)**. It is not necessary to purchase the guidewire on the bone of the lateral mass. If this is done, extreme care should be taken to make certain the Guidewire is safely docked well lateral on the lateral mass.

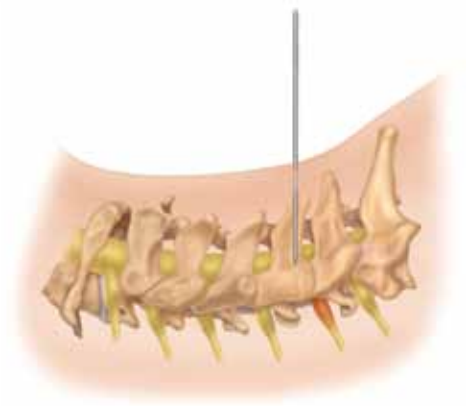

Figure 34

Dilator Insertion

Posterior cervical soft tissue is slightly more dense and requires more care to be taken as Dilators are rotated incrementally down to the lateral mass until the desired Tubular Retractor is in place **(Figure 35)**.

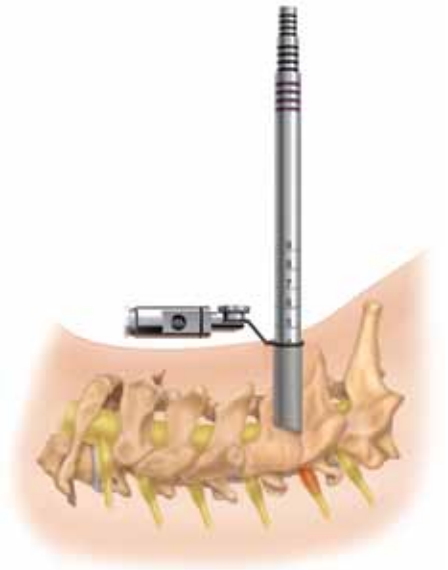

Figure 35

Soft Tissue Removal and Lamina Identification

The soft tissue over the lamina and intralaminar space is removed with an extended Bovie on low power and Pituitary Rongeurs **(Figure 36)**. If the Tube is correctly positioned, the junction of the two lamina with the medial facet should be seen in the Tube **(Figure 37)**. The initial laminar bites are taken in the caudal lamina in a caudal, then lateral, and then cranial direction, as the cranial laminar edge is addressed last **(Figure 38)**. The bony work should continue until each pedicle is exposed.

Figure 36

Figure 37

Cervical Root Identification and Disc Removal

With bipedicular exposure, the axilla is generally explored first. Frequently, a soft disc will be completely removed through the axilla. Occasionally, more cranially located fragments will have to be removed through the shoulder. The cervical Penfield and Hook can be used to gently retract the root in the axilla **(Figure 39)**. The disc will frequently be seen in this location. The Bayoneted Knife may be used to incise the ligament as needed. The longer Hook may be used to explore the foramen after removal of the disc. Cotton patties may be used to obtain hemostasis along with Microbipolar Forceps.

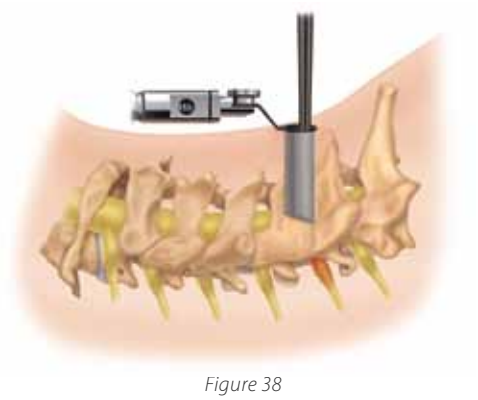

Figure 38

Closure

After the root is decompressed, the site is irrigated thoroughly with saline. The Flexible Arm should then be loosened and the Retractor slowly removed incrementally. Bleeding should be progressively controlled with Bipolar coagulation as the Retractor is withdrawn.

It is generally impossible to close the fascia. Subcuticular closures are done in an inverted manner and Steri-Strips or a Band-Aid may then be used as desired. Dermabond is also frequently used.

METRx™ MICROSCOPE Important Product Information

DESCRIPTION:

The METRx™ Microscope System is composed of a microscope, camera, an integrated video system, a video monitor and recorder, and various cannula, dilators, extension lenses, and associated instruments.

No warranties, express or implied are made. Implied warranties of merchantability and fitness for a particular purpose or use are specifically excluded. See the MSD Catalog for further information about warranties and limitations of liability.

INDICATIONS

The METRx™ Microscope is indicated for visualization of the surgical field in any area of the body cut open during a surgical procedure. When used in the cervical, thoracic, or lumbar spine either from an anterior or posterior direction, for example, the METRx™ Microscope and accessories are intended to aid the surgeon's visualization of the surgical area and allow him/her to perform any type of surgical spinal procedure such as herniated disc repair, visualization of the circumferential decompression of the nerve roots, aiding in the search and removal of nucleus material, spinal fusion, or insertion of spinal implants. Other examples of generic surgical use of the METRx™ Microscope would be for use in the knee, ankle, shoulder, hand, wrist, and temporomandibular joint (TMJ).

CONTRAINDICATIONS

The METRx™ Microscope and accessories have no known contraindications intrinsic to the device. No part of the microscope itself or its accessories should ever be used in a cutting or tearing action, i.e., never use the Microscope as an instrument. The optical device or its extension units should not be used to provide access to the surgical field. The device should not be inserted into body cavities, hollow organs, or natural body openings.

There are no other known risks associated with the use of the device outside of the normal and expected risks of surgery. The microscope should not be used non-sterile or in the presence of an infectious disease process.

DIRECTIONS FOR USE:

Specific instructions for use depend on patient considerations. Therefore, Medtronic Sofamor Danek cannot provide a surgical procedure that will be applicable to all situations. Any available surgical procedure brochure or manual for the METRx™ System Microscope device and accessories should be reviewed prior to use. The only critical directions for use are to insert the cannula or dilators and position them in the surgical wound prior to insertion of the microscope extension rod lens and inner field visualization of the surgical site. Never use the microscope extension to provide access or as a surgical instrument in the surgical field. Once visualization assistance is obtained, the surgeon can then complete the planned surgical procedure.

POTENTIAL ADVERSE EFFECTS:

Risks possibly associated with the use of the METRx™ Microscope and accessories are similar to those associated with any surgery to the planned area of instrument use. The most frequently stated risks are bleeding, neurological damage, damage to the surrounding soft tissue, and infection. Each of these risks has also been used to describe the risks associated with conventional surgical intervention. Additional risks associated with the use of METRx™ Microscope, other than those described for spinal surgery in general, may be instrument malfunction, such as bending, fragmentation, loosening, and/or breakage (whole or partial). Breakage of the tip in the patient may increase surgical time, since this instrument should not be implanted. Also, the surgery may not be effective. Similar risks are associated with the system use in other parts of the body.

Additional risks are attendant to surgery and the use of anesthesia, etc., and are not directly related to the use of the microscope and accessories. These include, but are not limited to, pneumonia, phlebitis, embolism, wound infection, blood loss with or without anemia.

WARNINGS AND PRECAUTIONS:

A successful result is not always achieved in every surgical case. This fact is especially true in orthopaedic or neuro-surgery cases where many extenuating circumstances may compromise the results.

In the event of technical complications, the surgical technique can be converted to an open procedure and the surgery completed.

Preoperative and operating procedures, including knowledge of surgical techniques are important considerations in the successful utilization of the system by the surgeon. Further, the proper selection of the patient and the compliance of the patient will greatly affect the results.

In addition, the following should be considered:

1. This device is a delicate instrument. It should **NOT** be dropped, bent at a sharp angle, or exposed to any type of gamma radiation. Tip fracture fragmentation and optic damage may result if the microscope is not handled carefully.
2. Additional microscopes and accessories should be available at the time of surgery in case of possible contamination due to mishandling or removing the devices from the sterile field.
3. Components of the system should be thoroughly inspected during cleaning prior to surgery for possible damage.
4. Proper, secure component connections must be made to assure proper functioning of the optical, irrigation, and aspiration aspects of the device.

CAUTION – HIGH TEMPERATURE

This light source is recommended for use with 100W light sources and 5mm fiber optic cables. Use of other cables and/or higher wattage light sources may result in high temperatures on the metal connection to the light cable which may result in injury to patient or staff and damage to product. Reduce intensity levels on high watt light sources and take precautions to protect patient and staff from injury.

CAUTION: FOR USE ON OR BY THE ORDER OF A PHYSICIAN ONLY.

!USA For US Audiences Only

CAUTION: FEDERAL LAW (USA) RESTRICTS THESE DEVICES TO SALE BY OR ON THE ORDER OF A PHYSICIAN.

CLEANING PROCEDURE:

Exterior cleaning of the microscope and camera head is essential prior to any sterilization procedure. The camera head should be removed from the microscope prior to cleaning. To remove blood, organic matter, and irrigation solutions, all surfaces of the microscope and camera head should be cleaned with a mild detergent and water. Rinse with distilled, demineralized, or pyrogen-free water. Dry thoroughly. Without the removal of all contaminants from the surface, the sterilization medium will not contact the surfaces.

WARNING: DO NOT USE ULTRASONIC CLEANER OR ABRASIVES DURING THE CLEANING PROCESS.

STERILIZATION:

The microscope, light cable, non-sterile instruments and instruments which are re-usable are recommended to be steam sterilized by the hospital using one of the following methods:

Some cameras (9560500, 9560501) are autoclavable following the same recommendations. If the products described in this document are sterilized by the hospital in a tray or case, it must be sterilized in a tray or case provided by Medtronic Sofamor Danek.

Some accessories and instruments are supplied sterile and non-reusable. Sterile product will be clearly labeled as such on the package label. The sterility of the product supplied sterile can only be assured if the packaging is intact.

NOTE: The following note applies to the process parameter identified with the * below: For use of this product and instruments outside the United States, some non-U.S. Health Care Authorities recommend sterilization according to these parameters so as to minimize the potential risk of transmission of Creutzfeldt-Jakob disease, especially of surgical instruments that could come onto contact with the central nervous system

METHOD	CYCLE	TEMPERATURE	EXPOSURE TIME
Steam	Pre-Vacuum	270°F (132°C)	4 Minutes
Steam	Gravity	250°F (121°C)	60 Minutes
Steam*	Pre-Vacuum*	273°F (134°C)*	20 Minutes*
Steam*	Gravity*	273°F (134°C)*	20 Minutes*

The microscope, camera and light cable can also be EtO sterilized. The following EtO cycle is recommended:

Preconditioning parameters		Sterilization parameters	
Temperature:	55 ± 2° C	**Ethylene Oxide Carrier:**	Oxyfume 2002
Relative Humidity:	≥ 35%	**Temperature:**	55 ± 2° C
Vacuum:	21 ± 1 In Hg (508-559mm Hg)	**Relative Humidity:**	≥ 35%
Preconditioning time:	1 Hour	**Pressure:**	19 ± 1 PSIG (2.25-2.39 bars)
		Ethylene Oxide Concentration:	736 mg/L
		Gas Exposure Time (Full Cycle):	4 Hours
		Aeration:	11 Hours at 54°C minimum

The microscope and camera should be thoroughly cleaned prior to sterilization.

The integrated video system, video monitor, and recorder are also reusable and supplied non-sterile. These components should not be placed in the surgical field.

CAUTION: SCOPES AND CAMERA CANNOT BE STEAM AUTOCLAVED UNLESS "AUTOCLAVABLE" IS ENGRAVED ON THE MICROSCOPE OR CAMERA BODY. THIS METHOD WOULD OTHERWISE PERMANENTLY DAMAGE THE OPTICAL COMPONENTS.

CAUTION: DO NOT IMMERSE OR RINSE INSTRUMENTS IN COLD WATER OR ANY OTHER LIQUID TO ACCELERATE COOLING.

PRODUCT COMPLAINTS:

Any Health Care Professional (e.g., customer or user of this system of products), who has any complaints or who has experienced any dissatisfaction in the product quality, identity, durability, reliability, safety, effectiveness and/or performance, should notify the distributor, Medtronic Sofamor Danek. Further, if this system ever "malfunctions," (i.e., does not meet any of its performance specifications or otherwise does not perform as intended), or is suspected of doing so, the distributor should be notified immediately. If any Medtronic Sofamor Danek product ever "malfunctions" and may have caused or contributed to the death or serious injury of a patient, the distributor should be notified immediately by telephone, fax, or written correspondence. When filing a complaint, please provide the component(s) name and number, lot number(s), your name and address, the nature of the complaint, and notification of whether a written report from the distributor is requested.

FURTHER INFORMATION:

If further information is needed or required, please contact Medtronic or your Sales Representative.

Important Information for Medtronic Instruments

PURPOSE:

This instrument is intended for use in surgical procedures.

DESCRIPTION:

Unless otherwise stated, instruments are made out of a variety of materials commonly used in orthopedic and neurological procedures including stainless steel and acetyl copolymer materials which meet available national or international standards specifications. Some instruments are made out of aluminium, and some with handles made of resin bonded composites, and while these can be steam autoclaved, certain cleaning fluids must not be employed. None of the instruments should be implanted.

Intended Use:

This instrument is a precision device which may incorporate a measuring function and has uses as described on the label.

Unless labeled for single use, this instrument may be re-used.

If there is any doubt or uncertainty concerning the proper use of this instrument, please contact MEDTRONIC Customer Service for instructions. Any available surgical techniques will be provided at no charge.

WARNINGS:

The methods of use of instruments are to be determined by the user's experience and training in surgical procedures.

Do not use this instrument for any action for which it was not intended such as hammering, prying, or lifting.

This instrument should be treated as any precision instrument and should be carefully placed on trays, cleaned after each use, and stored in a dry environment.

To avoid injury, the instrument should be carefully examined prior to use for functionality or damage. A damaged instrument should not be used. Additional back-up instruments should be available in case of an unexpected need.

MEDTRONIC does not and cannot warrant the use of this instrument nor any of the component parts upon which repairs have been made or attempted except as performed by MEDTRONIC or an authorized MEDTRONIC repair representative.

Implied warranties of merchantability and fitness for a particular purpose or use are specifically excluded. See the MSD catalog for further information about warranties and limitations of liability.

DO NOT IMPLANT THE INSTRUMENTS.

POSSIBLE ADVERSE EFFECTS:

Breakage, slippage, misuse, or mishandling of instruments, such as on sharp edges, may cause injury to the patient or operative personnel.

Improper maintenance, handling, or poor cleaning procedures can render the instrument unsuitable for its intended purpose, or even dangerous to the patient or surgical staff.

Proper patient selection and operative care are critical to the success of the device and avoidance of injury during surgery. Read and follow all other product information supplied by the manufacturer of the implants or the instruments.

Special precautions are needed during pediatric use. Care should be taken when using instruments in pediatric patients, since these patients can be more susceptible to the stresses involved in their use.

There are particular risks involved in the use of instruments used for bending and cutting rods. The use of these types of instruments can cause injury to the patient by virtue of the extremely high forces which are involved. Do not cut rods in situ. In addition, any breakage of an instrument or the implant in this situation could be extremely hazardous. The physical characteristics required for many instruments does not permit them to be manufactured from implantable materials, and if any broken fragments of instruments remain in the body of a patient, they could cause allergic or infectious consequences.

Over-bending, notching, striking and scratching of the implants with any instrument should be avoided to reduce the risk of breakage. Under no circumstances should rods or plates be sharply or reverse bent, since this would reduce the fatigue life of the rod and increase the risk of breakage. When the configuration of the bone cannot be fitted with an available device and contouring of the device is absolutely necessary, contouring should be performed only with proper bending equipment, and should be performed gradually and with great care to avoid notching or scratching the device.

Extreme care should be taken to ensure that this instrument remains in good working order. Any surgical techniques applicable for use of this system should be carefully followed. During the procedure, successful utilization of this instrument is extremely important. Unless labeled for single use, this instrument may be reused. This instrument should not be bent or damaged in any way. Misuse of this instrument, causing corrosion, "freezing-up", scratching, loosening, bending and/or fracture of any or all sections of the instrument may inhibit or prevent proper function.

It is important that the surgeon exercise extreme caution when working in close proximity to vital organs, nerves or vessels, and that the forces applied while correcting the position of the instrumentation is not excessive, such that it might cause injury to the patient.

Excessive force applied by instruments to implants can dislodge devices, particularly hooks.

Never expose instruments to temperatures in excess of 134° C that may considerably modify the physical characteristics of the instruments.

!USA For US Audiences Only

CAUTION: FEDERAL (U.S.) LAW RESTRICTS THESE DEVICESTO SALE BY OR ON THE ORDER OF A PHYSICIAN ONLY.

This device should be used only by physicians familiar with the device, its intended use, any additional instrumentation and any available surgical techniques.

For the best results MEDTRONIC implants should only be implanted with MEDTRONIC instruments.

OTHER COMPLICATIONS TO THE PATIENT AND/OR HOSPITAL STAFF MAY INCLUDE, BUT ARE NOT LIMITED TO:

1. Nerve damage, paralysis, pain, or damage to soft tissue, visceral organs or joints.
2. Breakage of the device, which could make necessary removal difficult or sometimes impossible, with possible consequences of late infection and migration. Breakage could cause injury to the patient or hospital staff.
3. Infection, if instruments are not properly cleaned and sterilized.
4. Pain, discomfort, or abnormal sensations resulting from the presence of the device.
5. Nerve damage due to surgical trauma.
6. Dural leak in cases of excessive load application.
7. Impingement of close vessels, nerves and organs by slippage or misplacement of the instrument.
8. Damage due to spontaneous release of clamping devices or spring mechanisms of certain instruments.
9. Cutting of skin or gloves of operating staff.
10. Bony fracture, in cases of deformed spine or weak bone.
11. Tissue damage to the patient, physical injury to operating staff and/or increased operating time that may result from the disassembly of multi-component instruments occurring during surgery.

OTHER PRECAUTIONS:

1. Excessive forces when using bending or fixation instruments can be dangerous especially where bone friability is encountered during the operation.
2. Any form of distortion or excessive wear on instruments may cause a malfunction likely to lead to serious patient injury.
3. Regularly review the operational state of all instruments and if necessary make use of repair and replacement services.

DEVICE FIXATION:

Some surgeries require the use of instruments which incorporate a measuring function. Ensure that these are not worn, that any surface engravings are clearly visible.

Where there is a need for a specified tightening torque, this may normally be achieved with torque setting instruments supplied by MEDTRONIC the pointer on these instruments must indicate ZERO before use. If not, return for recalibration.

With small instruments, excess force, beyond the design strength of the instrument, can be caused even by simple manual overloading. Do not exceed recommended parameters.

To determine the screw diameter with the screw gauge, start with the smallest test hole.

PACKAGING:

MEDTRONIC instruments may be supplied as either sterile or non- sterile. Sterile instruments will be clearly labeled as such on the package label. The sterility of instruments supplied sterile can only be assured if the packaging is intact.

Packages for both sterile and non-sterile components should be intact upon receipt. All sets should be carefully checked for completeness and all components should be carefully checked for signs of damage, prior to use. Damaged packages or products should not be used and should be returned to MEDTRONIC.

Remove all packaging material prior to sterilization. Only sterile implants and instruments should be used in surgery. Always immediately re-sterilize all instruments used in surgery. Instruments should be thoroughly cleaned prior to re-sterilization. This process must be performed before handling, or before returning product to MEDTRONIC.

EXAMINATION:

Instruments must always be examined by the user prior to use in surgery.

Examination should be thorough, and in particular, should take into account a visual and functional inspection of the working surfaces, pivots, racks, spring or torsional operation, cleanliness of location holes or cannulations, and the presence of any cracks, bending, bruising or distortion, and that all components of the instrument are complete.

Never use instruments with obvious signs of excessive wear, damage, or that are incomplete or otherwise unfunctional.

CLEANING AND DECONTAMINATION:

Unless just removed from an unopened Medtronic package, all instruments must be disassembled (if applicable) and cleaned using neutral cleaners before sterilization and introduction into a sterile surgical field or (if applicable) return of the product to Medtronic. Cleaning and disinfecting of instruments can be performed with aldehyde-free solvents at higher temperatures. Cleaning and decontamination must include the use of neutral cleaners followed by a deionized water rinse.

Note: certain cleaning solutions such as those containing formalin, glutaraldehyde, bleach and/or other alkaline cleaners may damage some devices, particularly instruments; these solutions should not be used. Also, many instruments require disassembly before cleaning.

All products should be treated with care. Improper use or handling may lead to damage and/or possible improper functioning of the device.

STERILIZATION:

Unless marked sterile and clearly labeled as such in an unopened sterile package provided by the company, all implants and instruments used in surgery must be sterilized by the hospital prior to use. Remove all packaging materials prior to sterilization. Only sterile products should be placed in the operative field. Unless specified elsewhere, these products are recommended to be steam sterilized by the hospital using the set of process parameters below:

METHOD	CYCLE	TEMPERATURE	EXPOSURE TIME
Steam	Pre-Vacuum	270°F (132°C)	4 Minutes
Steam	Gravity	250°F (121°C)	60 Minutes
Steam*	Pre-Vacuum*	273°F (134°C)*	20 Minutes*
Steam*	Gravity*	273°F (134°C)*	20 Minutes*

NOTE: Because of the many variables involved in sterilization, each medical facility should calibrate and verify the sterilization process (e.g., temperatures, times) used for their equipment. *For outside the United States, some non-U.S. Health Care Authorities recommend sterilization according to these parameters so as to minimize the potential risk of transmission of Creutzfeldt-Jakob disease, especially of surgical instruments that could come into contact with the central nervous system.

Important Information for Medtronic Instruments *Continued*

It is important to note that a sterilization wrap, package or sterilization container system should be used to enclose the case or tray in order to maintain sterility.

Although the treatment of the instrument, materials used, and details of sterilization have an important effect, for all practical purposes, there is no limit to the number of times instruments can be resterilized.

OPERATIVE USE:

The physician should take precautions against putting undue stress on the spinal area with instruments. Any surgical technique instruction manual should be carefully followed. If an instrument breaks in surgery and pieces go into the patient, these pieces should be removed prior to closure and should not be implanted.

REMOVAL OF IMPLANTS:

For the best results, the same type of MEDTRONIC instruments as used for implantation should be used for implant removal purposes. Various sizes of screwdrivers are available to adapt to the removal drive sizes in auto break fixation screws.

It should be noted that where excessive bone or fibrous growth has occurred from the first surgery, there may be added stress on the removal instruments and the implants. Both instrument and implant may be prone to possible breakage. In this case it is necessary to first remove the bone and/or tissue from around the implants.

FURTHER INFORMATION:

In case of complaint, or for supplementary information, please contact MEDTRONIC.

PRODUCT COMPLAINT:

Any Health Care Professionals (e.g., customer users of MEDTRONIC instruments), who have any complaint or who have experienced dissatisfaction in the product quality, identity, durability, reliability, safety, effectiveness and/or performance, should notify the distributor, MEDTRONIC. Further, if any instrument "malfunctions", (i.e., does not meet any of its performance specifications or otherwise does not perform as intended), or is suspected of doing so, the distributor or MEDTRONIC should be notified immediately. If any MEDTRONIC product ever "malfunctions" and may have caused or contributed to the death or serious injury of a patient, the distributor or MEDTRONIC should be notified as soon as possible by telephone, FAX or written correspondence. When filing a complaint, please provide the component(s) name and number, lot number(s), your name and address, and the nature of the complaint.
