

M-Thumb

Product descriptor

The M-Thumb was developed for someone with a complete absence of their thumb. It can provide a considerable improvement in function due to its multi-positional capabilities and adjustable resistance. The M-Thumb was designed to provide as much dexterity as possible to maximize the functional return for those who have lost a thumb. The M-Thumb can be rotated and flexed or extended to a position most useful for the user. The thumb also has a fingernail incorporated into the design to allow the user to pick up very small objects with ease and precision.
