Partial Flex

L7499- Two joint multi-articulating partial finger for PIP level limb loss
(One finger), Complete prosthesis- \$7500.00

Partial Flex justification

The Partial Flex is designed for someone missing a portion of their finger or fingers at the level of the PIP joint or slightly proximal. The multi-articulating joint allows for the finger to fully flex to optimize the user's ability to grasp objects more securely. The Partial Flex is cable operated so when the user flexes their MCP joint that motion causes the finger to flex so the user has direct control of positioning and force. The cable can be adjusted by the user to allow for adjustable tension on the cable as needed. Silicone grip tips are added to provide a soft feel and improved grip.
