

Thumb cage MSRP

L7499- Passive silicone thumb with micro frame, complete prosthesis- \$ 5625.00

Thumb cage justification

The thumb cage with a silicone interface and micro frame is designed to create an extension of the affected thumb to bring the affected thumb back to natural length. The thumb interface is made from silicone and the micro frame is made from high strength nylon to provide a comfortable, protective device and improve function with many grasping activities. The passive device is manufactured from a model of the patient's affected hand and the shape and size is determined by a mold of the patient's sound hand mold. The silicone provides a protective layer to cushion the limb inside the device. The device can be colored to match the users skin tone or color of choice.
