VueReno Bathroom Client Decision Report

Navy Blue American Style | Making each change work better for your space and daily routine

Your decision summary

See clearly what is worth keeping, what should change, what needs confirmation, and where to prioritize your budget.

1. VueReno Decision

KEEP | Keep

Keep the current toilet and bathtub locations. If the existing floor tile is in good condition, it can also remain. This avoids unnecessary plumbing work and lets you direct more of the budget toward improvements that have a stronger impact on daily use and the overall result.

CHANGE | Change

Prioritize the vanity, mirror, and task lighting at the mirror, while simplifying the open storage. Then coordinate the wall colour, vanity, and hardware so the room feels cleaner, more cohesive, and easier to use every day.

RISK | Confirm

The room orientation has not yet been confirmed, so the wall colour should be finalized only after physical sample testing. Before purchase or installation, also verify the dimensions, plumbing location, drawer clearance, glass door clearance, and lighting conditions on site.

PRIORITY | Priority

Direct the first part of the budget to storage and mirror lighting, then complete the colour and hardware coordination. A glass tub door, wet-area tile, and floor replacement can be treated as later upgrades if the budget allows.

PRIORITY = what deserves attention and budget first

Priority does not mean construction sequence. The actual work order should be confirmed by the contractor or the appropriate trade based on site conditions.

Space Suitability Assessment

Colour / Lighting / Storage / Movement / Maintenance / Size & Capacity

2. Six Core Checks

Colour	Use a warm off-white on the walls with a navy vanity to keep the small room bright while creating a clear focal point. Current candidates: Benjamin Moore White Dove OC-17 and Hale Navy HC-154.	Confirm / Risk Because the room orientation has not been confirmed, colour should not be finalized from a rendering alone. Test physical samples for 24 hours and observe them in daylight, shade, and evening lighting.
Lighting	Add more even front-facing light at the mirror to reduce facial shadows during washing, makeup, or shaving. Keep the ceiling light for general illumination. A colour temperature around 3000K-3250K is the preferred direction.	Confirm / Risk Confirm scone position, mounting height, proportions, and electrical conditions on site so the fixtures do not conflict with the mirror or vanity.
Storage	The goal is not to add more cabinetry, but to organize daily-use items more effectively. A drawer vanity can reduce clutter on the counter. The three existing shelves on the left can remain, with fewer displayed items.	Confirm / Risk Before buying the vanity, confirm the drain location and whether the internal drawer configuration is compatible. Keep only a limited number of frequently used items on open shelves to avoid visual clutter.
Movement	The main layout can remain. A high budget does not justify moving the toilet, bathtub, or plumbing when there is no clear functional need. Keeping the layout also helps control renovation complexity in this narrow room.	Confirm / Risk If a glass tub door or panel is added, confirm the opening direction, tub access, clearances around the toilet and vanity, and the main passage width.
Maintenance	Closed storage reduces counter-cleaning effort. Larger-format wet-area tile can reduce grout lines, and a glass panel can make the room look cleaner and more open.	Confirm / Risk Glass still requires regular water-spot cleaning. Whether to replace wet-area tile or floor tile should depend on the current condition, your maintenance preferences, and your budget; neither is automatically required.
Size & Capacity	In a narrow bathroom, every new item must do more than look good: it must fit, open properly, and leave enough room to move. Key checks include vanity width/depth, drawer opening, mirror width, sconce spacing, shelf depth, and glass-door swing.	Confirm / Risk Key site dimensions are not yet complete. All installed products and clearances must therefore be rechecked on site. Final dimensions and installation feasibility must be confirmed by site measurement and qualified professionals.

Phased Budget Direction

Budget Allocation by Priority | Address the biggest daily-use issues first, then refine the overall look

3. Recommended Budget Priority

PHASE 1

ESSENTIAL

Main items

Vanity and closed storage
Mirror + task lighting
Lighting quality and colour temperature
Essential hardware coordination

Budget logic

Start with the items that affect daily use most: storage, mirror lighting, and basic function.
If the budget needs to be controlled, this is the most valuable stage to fund first.

PHASE 2

VISUAL COORDINATION

Main items

Warm off-white wall direction
Navy vanity as the main focal point
One coordinated metal finish for faucet / pulls / towel bar
Simplified accessories and soft details

Budget logic

Once daily use is improved, coordinate the wall colour, vanity, hardware, and accessories.
The goal is not to add more items, but to make the room feel more cohesive and complete.

PHASE 3

PREMIUM UPGRADE

Main items

Glass tub door / panel
Larger-format wet-area tile
Floor tile replacement if needed
Other non-essential material upgrades

Budget logic

This stage mainly improves finish quality and maintenance experience.
If the existing floor and wet-area materials are in good condition, they can remain without compromising the first two phases.

FINAL CHECK

1. Colour: test physical samples for 24 hours in daylight, shade, and evening lighting.
2. Size: before purchase or installation, verify the vanity, mirror, sconces, shelves, glass door, and main passage dimensions on site.
3. Construction: plumbing, electrical, waterproofing, wall openings, custom glass, structure, and installation methods must be confirmed by the appropriate professionals on site.
4. The phased budget direction shows recommended spending priority only. It is not a construction sequence and is not a construction quote.

ON-SITE CONFIRMATION REQUIRED | Final dimensions and installation feasibility must be verified on site.
