

1987-1998 Ford Trucks with a 7.3L originally were equipped with a dual mass flywheel. Platinum Driveline offers replacement clutch kits and corresponding solid flywheels. New bolts come with these new flywheels and must be used with a thread sealant to prevent oil leaks that could potentially leak onto the clutch disc material.

You must tighten the bolts in a star pattern. 1987-1994 models with indirect injection, tighten to 45-49 ft. lbs. (Flywheels **167324** and **167325**). On 1994-1998 models with direct injection, tighten the bolts to 85-90 ft. lbs. (Flywheel **167323**). The pressure plate bolts on these models should be tightened to 15-20 ft. lbs.

Years	Engine	Application	Clutch Kit	Clutch Size	Flywheel
1987-94	7.3L	Diesel, or aftermarket turbo	07-131	12 1/4"	167325
1993-94	7.3L	Factory Turbo Diesel w/indirect F.I.	07-131	12 1/4"	167324
1994-98	7.3L	Factory Turbo Diesel w/direct F.I.	07-154	13"	167323
