

In the Beginning

In the beginning, there was darkness. There was nothing, no people, no world. This story is how the Earth was created. No one knew what Earth would look like because no one was around to see it.

BANG!

The date was 20 million BC when cavemen roamed the Earth. Earth had all its features in the atmosphere, and it was called the weather. When the sun went dark and the clouds of cotton wool wept abundantly, that was called raining. When the sun looked like it was cut in half it was called a sunset or sunrise depending on the time of day. When the rain met the sun for the first time there was a variation of colours. This phenomenon was called a rainbow. The rainbow had all the colours imaginable with its first colour being a rod hot red then there was obnoxious orange, yawning yellow, glamorous green, bubble gum blue, inspirational indigo and last but certainly not least voluptuous violet.

This story will take us to the very first human. His name was Ug. Like any original name, his name didn't have anything exciting. Ug did sports, but I don't think he knew it was called running. Probably it was called Ugging. It was Ug's way to stay fit.

As time went on, Ug grew up and fell in love with another person called Uge. Uge was pretty and she also fell in love with Ug. They made fires and threw sticks at birds but the only thing they loved more was going on adventures together. They would find loads of new animals and reptiles, but on one walk, Uge found other people that looked completely different. Their names were Tok and Tome.

As soon as Tok and Tome introduced themselves, Uge had an instant connection with Tok. A few days later, they got married and Uge had triplets; they were called Gertrude, Oliver and Felix. When the triplets grew up, they had built Tudor homes. As a couple of weeks went by, Gertrude had triplets and Felix and Oliver's wives had also had triplets. There were so many triplets there was no room on Earth for another single human being. The triplet terror only became a real terror by 2050.

The population grew at a massive rate and the universe needed someone to stop it. So, Hawkins laboratory was created and they made a cure for overpopulation. It was called Tangenlogothic or TLC for short. It was to kill... no, 'decrease the population to a reasonable size'. The depopulation was like a reset button, but without destroying what the Earth needed. A couple of years went by, and new islands and countries were created. The new islands and countries were the best place for other ethnicities to go to and spread peace and love.

From the satellite, scientists could see the spherical shape of our Earth. It was wonderful. This made it on the front cover of the most read newspaper ever, and it was called the Earth.

You could hear radio stations talking about it. Some people even made a giant jam filled doughnut that was coloured to look like Earth. It also smelt and tasted great. The yummy treat was squishy like jelly. The whole world was created, just because it wanted to bring peace and love. So how was the universe created?
