

Movie Review: The Day of the Jackal

The movie *The Day of the Jackal* is a classic thriller about a professional assassin hired to kill the President of France. Unlike many modern action movies that have lots of explosions, this film is about patience and planning. The main character, known only as "The Jackal," is a cold and clever man. Watching him prepare for his mission is like watching a dangerous game of chess.

The Plot: A Race Against Time

The Jackal is a ghost. He has no real name and uses many different fake passports to travel across borders. To carry out the assassination, he builds a custom gun that he can hide inside a metal crutch. While he is planning the kill, a detective named Lebel is trying to find him. The movie is exciting because the audience sees both sides: the criminal making his plan and the police trying to catch him before it is too late.

Why It Is Relevant Today

Even though this movie was made years ago, it feels very modern because of how it talks about security and technology.

Identity Theft: In the movie, the Jackal steals identities to stay hidden. Today, we face a similar problem with cybersecurity. Instead of fake paper passports, hackers today use "digital disguises" to steal information or attack governments.

Drones and Remote Weapons: In the 1997 version of this story, the Jackal uses a remote-controlled gun. Today, we see this in real life with drone technology. Modern warfare and even some crimes are now committed using robots or remote devices, making it harder for the police to protect people from a distance.

Political Tension: The movie shows how one person's actions can change a whole country's history. Today, we still see deep political divisions. The movie reminds us that security is not just about walls, but about being faster and smarter than those who want to cause chaos.

Conclusion

The Day of the Jackal is a great movie for high school students because it teaches us about consequences. It shows that even the most perfect plan can fail because of a small mistake. It also makes us think about our world today—where technology makes us feel safe, but also creates new ways for "Jackals" to hide in the shadows.
